cashed his spade Q. As a result,

South lost three heart tricks, a dia-

Declarer should have attempted

to set up hearts before drawing

trumps. Had he played that way, he

would have lost only two hearts and

Had he been playing for a 3-Spade

contract his procedure was correct,

as finding the trumps divided was

the only possible chance to make his contract. As the cards lay, he would have gone down two, however.

a trick in each of the other suits.

mond, a club and a trump.

BARCLAY ON BRIDGE

By Shepard Barclay

"The Authority on Authorities"

CONSIDER YOUR TASK YOUR PLAN OF play depends artly upon the height of the conact What would be the sole posile chance to make a three spade ntract may be utterly wrong when you are playing for only two spades. Then you may be able to sacrifice a trick on a safety play which makes the success of the contract a sure thing or very nearly one.

South bid 1-Spade on this deal, West passed and North bid 2-Spades, which ended the bidding.

West led the club Q, which declarer won. He then cashed two munds of trumps. Next came a against South's contract of 4heart lead. West won and then Spades? Copyright, 1938, King Features Syndicate, Inc.

Happiness Is Up To Optic Thalami

These Groups of Ganglia in Brain Are Centers for the Co-ordination of Sensation

IF WE examine a series of brains of the lower animals in an ascendat the lower animals in an ascending scale up to man, we find that in the lower forms the top of the brain is given over to large masses of a nervous ganglia which have to do with such things as smell, vision, hearing and motor co-ordination. The higher you go, the more these ganglia are covered over by real. ganglia are covered over by real— it is difficult to find a word for it, but we will call it "thinking" tissue. When you get to the human brain, the "thinking" tissue is a great mass on top, and the ganglia that have to do with co-ordination are almost hidden underscath.

with co-ordination are almost hidden underneath it.

But they are there just the same, and very important and necessary to our happiness they are, too. You have probably never heard of one of these groups of ganglia—the optic thalami—but the life, liberty and happiness of every one of you depend upon the intactness of your optic thalami.

Co-ordinate Sensation

The thalami are the centers for the co-ordination of sensation, as the cerebellum is the center for the lination of motion.

It is not easy to describe just what the thalami do. They receive impressions of sense, especially those toking pleasure and discomfort and consciousness of sharpers of state. asciousness of changes of state. hen they relay these to the higher can centers. The higher centers are more discountered.

LOGAN CLENDENING, M. D., thalami, the patient says, "Some thing is happening to me; I am being hurt", instead of, "You are sticking a pin into the back of my hand". ing a pin into the back of my hand".

The usefulness of the thelami probably lies in the absorption and sorting out of sensations. We are constantly having more sensations than we can handle. The thalami receive all these and classify them and adjudicate them. If they are important, the thalami send them up to the big boss.

The cerebellum does the same sort of thing on the motor side. To my way of thinking, the cerebellum is the most marvelous organ in the human body. It is the only one that is absolutely perfect, and woe be unto you if you lose the governing of your cerebellum.

Here is what the cerebellum does. You are sitting in your chair reading this newspaper. You decide to toss it on the chair next to you, and with uncanny accuracy it lights exactly on the seat of the chair. If you measured the exact distance, the weight of the paper and the amount of muscular force required to throw it there, and then proceeded on the basis of your mathematical calculations, the chances are your attempt would be an abysmal failure. But the cerebellum does all this calculating for you and the result is perfect. Here is what the cerebellum does
