Far-Famed Lands of Marlboro. Resistant to the ravages of the Charlotte Observer.

Last Monday the estate lands of Eli T. Covington of Hebron was sold at auction, containing nearly 100 acres. It brought \$90 per acre, and was purchased by Mr. C. M. Weatherly, a merchant of Bennettsville.

Mr. John J. Pearson of Bennettsville owns an eight-horse farm in the lower part of the county, which is worked by tenants. Mr. Pearson stated to your correspondent yesterday that his tenants had this year cleared on the cotton crop exclusively, after paying all expenses, something more than \$1600. Such farming as that is a veritable Klondike, and many tenants in Marlboro county, after paying \$5 to \$7 per acre rent, are amassing money, and some of them are purchasing plantations at \$30 and \$40 per acre.

Mr. Charles Crostland, one of the progressive farmers of the county, stated this week that he would make this year, on 50 acres of land, 65 bales of cotton, and this is an off year for farmers in this county, especially for cotton farmers. Capt. P. L. Breder told your correspondent that he would average one heavy bale of cotton per acre on his entire farm of 600 to 700 acres. These gentlemen always make an abundance of grain. Mr. Charles Crostland now having 400 bushels of old corn from last year's crop, shows that farming in Marlboro county pays better than anything else.

Mr. E. W. Breder near town rented 100 acres of land to the watermelon truckers and received \$7 per acre or \$700 for the 100 acres. He put the land in pea vine hay, harvested and baled same and received one-half, which netted him something like \$25 per acre, making more than \$200 per acre his land returned him this year in the way of rent.

[A Monroe man owns a farm in this county from which his rents this year amounted to more than \$500.]

Black Rot of the Cabbage. Correspondence of The Journal.

For more than fifteen years there has existed in North Carolina a very serious disease of cabbage and other crops of the cabbage family.

The annual damage in this State from this disease is probably more than \$10,000. Besides cabbage, upon which it most frequently operates, this disease attacks turnips, kale, cauliflower, mustard, rape, and in fact all crops and weeds of the cabbage tribe.

The disease in cabbage is characterized by the outermost leaves of the plants, near the edges, turning first yellow, then brown and finally black. The disease spreads downward into the main stem and through this into the inner leaves of the head. While no plant of the cabbage kind is wholly exempt, those of a loose or spreading habit like the collard are less damaged than those which form close heads, like the flat Dutch type. The disease is very contagious, spreading from plant to plant in the field. Frequently large patches of cabbage apparently healthy one day are found soft and rotten the next. The disease is always most virulent in hot, moist weather.

CAUSE OF THE DISEASE. Black rot of the cabbage and other plants of the same family, is caused by a germ or microbe, Bacillus caespitosa. This germ lives from year to year in the soil, attacking with increasing violence successive crops of the cabbage kind, until at length it becomes practically impossible to grow these crops except upon fresh or virgin soil. The germ increases rapidly only during the warmer months of the year, or while the temperature is above 80° F.

TREATMENT. The treatment for black rot must be preventive. Spraying is of no value in this case. Rotation of crops so that no crop of the cabbage family shall come upon the same field often than once in three or four years is the first and most essential precaution. The seed bed should be made upon fresh ground each year, or the bed should be burned over as is done for tobacco beds, to kill possible germs in the soil. Cabbage, turnip and all other crops of this family should be grown only during the cooler months, or while the temperature is below 80° F. If only a few scattered plants in field show the characteristic yellowing or blackening of the leaves, such plants should be pulled up and burned. Do not throw diseased cabbage leaves or plants upon the manure pile. The germ can live for an indefinite period in the manure, and will be scattered over the fields with the manure. In cultivating a field which contains diseased cabbage or other plants of this family, before going into another field clean all tools carefully and thoroughly to avoid carrying the germs into fields as yet free from them. Wage a vigorous war against shepherd's purse, pepper grass, and all other weeds of the cabbage family, as these may serve to propagate the disease during years in which other crops occupy the land.

Except as stated above no particular variety of cabbage is exempt, and no special brand of seed will ensure freedom from the pest.

Whatever may have been your excuse in the past for not paying your doctor, you have little excuse this year for not settling your account. Any doctor that is fit to practice medicine is worthy of a standard measure of medical ethics on the part of the people.

Keep in mind your relations to your physician and remember your first duty is to pay him.
