THESE POLITICAL PLUMS

President Truman and his Democratic Party spokesmen in Wisconsin were recently accused by Governor Kohler of "using the misfortunes of midwestern flood victims to further their own political ends." The Governor's statement was made after the president charged Thursday that midwestern governors are "dragging their feet" on the flood control problem.

"The president and his Democrat counterparts in Wisconsin are more interested in using the flood to gain their own political ends, than they are in helping the flood victims," Kohler said.

"While the president charged the midwestern governors with dragging their feet, he confessed that he still has not made up his mind regarding the Hoover Commission recommendation that the flood control work of the army corps of engineers and the bureau of reclamation be consolidated," Kohler said. "If anybody's feet are dragging, it's President Truman's," he added.

"The president called seven midwest governors to a conference on flood problems wasting his day and ours. He did not seek any information on flood conditions in Wisconsin nor did he discuss or suggest any solution to the problem of the Mississippi. Instead, he made a political speech, in behalf of flood control programs which the Hoover Commission has branded as exceedingly wasteful because of the competition and duplication which exists between the corps of engineers and the bureau of reclamation.

"I would like to suggest to the president that he might better have spent the day studying the Hoover Commission recommendations and deciding to approve them so that economical flood control measures could be developed which the midwestern governors could conscientiously support.

"He might also, during his flight across Wisconsin, have studied the conditions on the Wisconsin river here. They should be an education to the politicians who believe that big government is the only solution to our national problems.

"Had Mr. Truman done so, he could have observed that there will be no flooding of cities on the Wisconsin River because of the dams and reservoirs constructed on the river with private capital.

"He could have observed that long before the Democrats seized on flood control as a political issue, and another means of forcing America into socialism, private enterprise in Wisconsin, with legislative authorization and encouragement harnessed the Wisconsin River, ended its floods, and put the river to work.

"The spring run-off in this largest tributary of the Mississippi river north of the confluence of the Missouri is being stored in ponds and reservoirs, instead of adding billions of gallons of water to the misery of those who live along the Mississippi.

Kohler said that, barring an unprecedented heavy rain, Wisconsin nor did he discuss or suggest any solution to the year. The quantity of water already stored this spring is 16,000,000,000 cubic feet, an amount sufficient to flood 735,000 acres, or 1,130 square miles of land, to a depth of six inches.

"The Wisconsin River reservoirs have been built by private enterprise, operating under a charter issued by a far-sighted Wisconsin legislature almost 50 years ago," Kohler said. "This river improvement program demonstrates not only that floods can be controlled, but that they can be controlled with installations built by private firms without public subsidy and with continued tax revenue to the state."

Your County Agent Says

Chemical Sucker Control in Tobacco

The use of white mineral oils and oil emulsions on tobacco for sucker control is a matter of great interest to tobacco growers especially with the labor situation being what it is. There has been two years' testing of the oil-emulsion on tobacco under a rather wide range of conditions.

Of the materials used, the heavy grades of white mineral oil and emulsifier mixed with an equal quantity of water has given the most satisfactory results. Both the straight oil and oil-emulsion has given very good sucker control when properly applied and very little or no damage to the plants under favorable weather conditions; however, under damp, hot, humid weather conditions, soft rot may be a major problem. The oil-emulsion has given much less soft rot than the straight oil, but under some conditions even the oil-emulsion may cause more damage to the plants from soft rot, than the grower can afford to lose.

In a majority of the experiments, demonstrations, and farmer trials with oil-emulsion, the incidence of soft rot has been rather low; however, in a few extreme cases the percent of dead or damaged plants has been much higher than the benefits derived from the use of the materials. Because of the danger of soft rot, the use of white mineral oil or oil-emulsions for the control of suckers cannot be recommended for general use at this time.

If a grower wishes to try this method of sucker control on a small scale, there are several points that may be helpful.

1. One of the commercially prepared white oils with an emulsifier should be mixed with an equal quantity of water. This is the most satisfactory material used thus far. About 1/2 to 1 teaspoonful of this emulsion should be used per plant, depending upon the size of the plants.

2. The plants should be topped and treated about the time the first flowers begin to open. Suckers longer than 2 to 3 inches may not be affectively controlled.

(3) The plants should be treated during a comparatively dry period if possible, because sucker control is best during dry weather and damp, humid weather immediately after treating seems to increase the amount of soft rot.

4. The quality of flue-cured tobacco treated with oil-emulsions or plain mineral oil thus far has been judged to be equal to that topped and suckered by hand.

(5) White mineral oil and oil-emulsion has caused much heavier losses from soft rot in Eurlay than in the case of flue-cured.

(6) Use just enough material to reach the bottom of the plant. Excessive quantities will result in a higher percent of soft rot.

Mechanical applicators will probably not be generally available to growers this year; only a few are being made up for field trials. However, the paint brush, sponge, oil can and small syringe have all been used for applying the material.

We hope to have one of the clip-oil units within the next 10 days and will put on a number of demonstrations throughout the county to see how this material will work.

Any farmer interested in conducting one of these demonstrations should contact the County Agents' Office and let us know when your tobacco will be ready to top.
