**PRINCE ALEXANDER OF TECK**

Canada's New Ruler Descendant From Mmorganatic Marriage—More Royal Than King Himself.

London.—Announcement of the selection of Prince Alexander of Teck, the brother of Queen Mary, to succeed the duke of Connaught as governor general of Canada has served to again bring to mind the romantic history of the house of Teck.

The status of the Teck family is most peculiar. Though descended from a morganatic marriage contracted 75 years ago, the family has given a queen consort to Great Britain, whose

Prince Alexander of Teck.

eldest son will, if he lives, succeed his father on the throne. Also Prince Alexander of Teck, though his family has not been classed with royalty, is one generation nearer to George III than is the present king. He is, through his mother, a great-grandson of that monarch, whereas George V is a great-great grandson.

The first duke of Teck was the son of Duke Alexander of Wurttemberg by his morganatic wife, Countess de Rhede, who subsequently received the "augmentation" of countess of Hohensteln. The countess was not of "equal birth" of the duke, and he could not obtain the consent of his kinfolk to have the union treated as other than a morganatic marriage.

The offspring of this union, who might call himself count of Hohensteln, duke or prince of Teck, as he listed, came to England and married Princess Mary of Cambridge. They were the parents of Queen Mary and of Prince Alexander and his brothers.

**DAMAGED STATUES IN BERLIN**

Retired French Army Officer Broke Marble From "Sieges Allee" Monuments.

Berlin.—Serious acts of vandalism have been perpetrated in the famous "Sieges Allee" here. Four statues were badly damaged and the beaks of several of the marble eagles which form the arms of the benches in the "Allee" were found to have been broken off.

A man who, at about the time of the outrage, was seen to step over the chain surrounding one of the statues was arrested in connection with the affair, and in his pockets were found a stone of considerable size and a strong knife.

The prisoner gave his name as Antoine Astier, a pensioned staff surgeon of the French marine. His age is given as forty-one.

The statues which Astier damaged were those of Frederick the Great, the Elector Joachim Friedrich, the Elector Joachim II and Margrave Heinrich II. Astier claims to possess a Raphael "La Belle Jardiniere," which he desires to sell to the city of Berlin for £1,600,000.

**WALKS 17 MILES TO PREACH**

Rev. A. M. Rich, Missing Train for First Time in Years, Sets Out on Foot.

Quitman, Ga.—Proving that the notable exploits of the old-time circuit rider are not beyond the clergy of today, Rev. A. M. Rich walked 17 miles to keep his engagement with his Quitman congregation at St. James' Episcopal church.

Mr. Rich intended catching the afternoon train at Quitman from Valdosta, where he has his residence and is pastor of Grace church. He missed the train, however, for the first time in nine years, he insisted. He determined to keep the appointment here and started out to walk the distance. It is 17 miles by railroad and longer by the highway.

Mr. Rich arrived ten minutes late, and none of his congregation was aware until afterward that he had walked.

**Wife Used Rolling Pin.**  
Chicago.—Louis Tuft of Harvey, Ill., has filed suit for divorce charging that his wife "struck and injured said plaintiff severely with a rolling pin."

**MAKE USE OF OLD BICYCLE**

Power for an Emery Stone May Be Obtained by Using Discarded Parts of Velociped.

An old bicycle may be used to furnish power for an emery stone. It can be rigged up on the frame of an old grindstone, or something similar. The large sprocket and pedals are placed between the two 1 by 4s of the grindstone frame, as in the drawing, the hub, on either side, fitting into large holes bored into these cross-pieces, writes Floyd C. Miller of Inola, Okla., in Farmers Mail and Breeze. The counter shaft is placed below the top of the frame. The mandrel is

Power for Emery Wheel.

raised about 3 inches so the stone will not rub against the counter shaft. If there are no boxings handy, good ones may be made from maple, or other close grained wood, and rabbitted. A is the emery stone, B the counter shaft, C small sprocket on the stone shaft, D large bicycle sprocket, D sprocket chain, and F the bicycle saddle.

**VALUE OF PLOW AND HARROW**

In Purchasing Implements for the Farm Their Construction Should Be Carefully Studied.

(By R. G. WEATHERSTONE.)

The value of a plow or other farm implement consists of its doing the thing we want it to do. The plow with a light draft simply turns and cuts the furrow with the least resistance, resulting in very smooth work to look upon, but its effect upon the soil is not nearly so valuable as that of the plow that runs harder and gives more resistance to the soil and breaks it up finer. The plow that has a harder draft goes through the soil and not only breaks it up and turns a furrow, but in the process it grinds and pulverizes it into smaller particles.

The more thoroughly the soil is broken up, the more the plant food is made available and plant food is what we are after. In purchasing plows we want to study their construction with this in mind. The same applies to the selection of the harrow. The harrow that has an easy draft cannot do as good work as one that moves more soil and runs deeper. A harrow should do smooth work and incorporate the vegetable matter and fertilizers with the soil in a uniform manner.

The function of the harrow is to still further reduce and refine soil particles, because in every process of refinement we are getting at the plant food which is still so abundant in our soil. On the average farm where there are various types of soil, a disk harrow, a spring tooth harrow and a smoothing harrow are practical necessities. It is worse than folly for farmers to spend for commercial fertilizers or chemical plant foods until they have first made use of that which is so plentiful in their own soil at the present time.

I am a firm friend of fertilizers but I do not believe in buying them until we have made use of every method of getting at the plant food already contained in our soils.

**GROWING RUSSIAN CABBAGE**

Conspicuous Because It Requires Two Weeks' Less Time to Mature Than Other Varieties.

Among the maturing varieties of cabbage the Volga, a comparatively new sort in America, is conspicuous because it requires about two weeks' less time than other varieties of this class to mature, says Farm and Fireside. Concerning it the late C. L. Allen, whose book on cabbage, cauliflower and allied plants is the acknowledged authority, writes: "This new Russian variety is of the greatest uniformity. In a field of several acres frequently not a single plant shows any variation from a true and valuable type. In some respects it is a vegetable wonder, as the heads are about equal in size and shape, weighing from 12 to 15 pounds each, round as a ball, the largest measuring about 12 inches in diameter either way. Unlike most varieties, the heads are perfectly solid, and the stem does not run up into the head; the flesh is exceedingly firm, tender and white. In respect to hardness, we have never seen a type which would favorably compare."

**Feed Calves in Stanchions.**

Calves should be fed in a stanchion so constructed as to prevent them from sucking each others' ears after they have drunk their milk. The feeding of grain by placing a little before them after every meal of milk will also discourage the desire to suck the ears of the calf in the next stanchion.

**Proper Pruning.**

When pruning, have a reason for every cut made and cut close to the limb or trunk. Leave no stubs.

**POULTRY FACTS**

**BROOD COOP IS RAT-PROOF**

Board Floor Affords Satisfactory Shelter From Rodents—May Be Made Any Size Desired.

I use a brood coop that is satisfactory. The drawing practically explains itself. It may be made in any size desired although I think mine is about the right size, writes Mrs. Ella White of Lincoln, Neb., in the Farmers' Mail and Breeze. It is about two feet long, 16 inches high in front and 10 inches in the rear. I have a board floor in mine which makes

A Rat-Proof Brood Coop.

them rat-proof. Chicks will thrive better on dry earth floors, however. The last of these coops were made with hinged floors. It takes very little time to turn back the coop and put a little earth on the floor then replace the coop. I change this earth frequently so as not to allow it to become foul. The holes in the coop are for ventilation.

**MITES CAUSE IMMENSE LOSS**

Common Sentiment Among Farmers That All Flocks Are Troubled by Little Marauders.

Many a keeper of poultry has had occasion to regret not being careful enough about the nests where the birds lay and where they hatch their broods.

On farms where poultry are neglected it is safe to assume that the nests are worse neglected than any other feature of the poultry establishment. In the majority of neglected flocks it will doubtless be found that mites are present. In fact, it is common sentiment among farmers that all flocks have mites. The presence of mites in the poultry house means that they are enormously abundant in the nests, where they hide under the nest material.

When some nests are lifted up it is found that the under part of the straw is alive with these very small marauders. Think of hens trying to stay long enough on such nests to deposit eggs but, what is worse, think of hens trying to hatch out broods with these parasites attacking them nightly.

Where mites are present the nests must be cleaned out every few days and the old material burned. Also the nest boxes should have the cracks filled up to prevent the mites from finding a hiding place. One of the very good materials to use for this purpose is what is called "tar" in the east and "pitch" in the west. It is the kind used on the hulls and rigging of vessels and is not the coal tar so commonly used for various purposes.

The pitch is solid and easily fills up the cracks and all apertures and will last forever. It can usually be purchased in small quantities and will be found very useful to have about.

**FEEDING THE BABY CHICKS**

Oregon Experiment Station Makes Recommendation of System to Be Followed by Poultryman.

The Oregon station recommends the following system of feeding baby chicks. No food is given until the chicks are about thirty-six hours old. They are then given bran, mixed crumbly with raw egg, or bread dipped in milk and squeezed dry, twice a day for the first week, and equal parts of cracked wheat and cracked corn on clean sand three times a day. After two or three days the grain mixture is fed in the litter. Clean water, grit, charcoal and cracked bone, in separate dishes, are kept before them. They also have access to green food. When one week old the chicks are fed a moist mash of three parts bran, one part wheat middlings, one pound corn meal, and a pinch of salt—about what they will eat up in an hour—grain mixture two or three times a day, beef scraps in a hopper, and other supplies as before. When three weeks old they have milk added to the ration.

**Care of Hatching Eggs.**

A breeder of fancy poultry who hatches his chicks altogether with hens gets the straw matting around bottles and tea and lines his nest boxes to prevent possible breakage of eggs against the sides of the box. He changes this frequently as a precaution against mites.

**Lime is Good Thing.**

Lime is a very good thing to use about the poultry houses. An occasional coat of whitewash on the walls and on the nest boxes greatly improves the look of the house, besides being a good disinfectant and vermin killer.
