ROAST 'EM!

The position of a local newspaper in its own community is possibly fully understood by twenty five per cent of the people. For this reason too often actual injustice is either done the paper, or it is held in the minds of some people, as having done wrong, when it had nothing to be justiy accused of. The local newspaper while it may be the property of one or more persons, is also in a

community sense the property of all. Editorially, it can stand for rance, but the percentage on this itself, only, and in a broader sense account must be very small. There stand for its community. It is are cases in this city that ocea- Complex System by Which Insects Are than a foot this would mean a rate of presumed to publish such local sionally call for assistance, and a and foreign news, as its owners local organization helps the needy, fishes gills, insects have neither one the bullet to enter one side of the padeem best for its readers, or best but real poverty is practically un- nor the other. Singing Wires. Sometimes when a tempest is raging telegraph wires are silent, while in time of calm they are sonorous. Evidently the vibration of the wires is not due to atmospherical agitation alone A scientist of Berlin who studied the cause of the singing of wires in time of calm concludes that the vibration of the wires always presages the approach of bad weather. When the sounds are deep the change of weather may be looked for within two days. When they are shrill or sharp the storm will come within a very few hours. It is difficult to determine the cause of the singing. An Italian scientist calls it "seismic agitation produced by barometric depression and trans-mitted to the wires by the telegraph poles."-Harper's Weekly.

Finding the Velocity of a Missile a Simple Matter.

### MEASURED BY A PAPER DRUM.

The Whirling Cylinder Registers the Projectile's Flight With Minute Accuracy at Any Desired Distance. Wing Shots and Shot Charges.

Persons at all interested in gun firing of any kind, whether of the revolves "muzzle velocity" and velocities of the missile at stated distances.

"How can anybody tell how fast a bullet is traveling when it leaves the muzzle of a weapon F is a likely comment on the part of the layman.

As a watter of fact this approximate velocity of the missile may be one of the easiest of determinations to make. In the first place, a drumlike cylinder is made of fixed diameter and of sufficiently stiff paper to allow of its recylinder of small circumference, it is necessary that the speed approach 2,000 revolutions a minute. These revolutions are produced by electric power, and the count is made by an exact mechanical register.

The gun is placed securely at the required distance from the drum and is sighted directly at the center of the cylinder, which is spinning at so many rods, even miles, a minute, as its circumference determines. With the drum's speed adjusted an electric current discharges the weapon, the bullet striking the center of the drum as measured from top to bottom.

The reader understands that with the drum stationary the bullet would pass directly through it on the line of its diameter, coming out on the other side with scarcely a shade of impediment. With the drum's periphery whirling at and its diameter only a fraction more 2.000 yards in sixty seconds. Thus in White mammals have lungs and the fragment of a second pecessary for complex system of tubes running side the opposite side of the drum throughout the length of their bodies, would show considerable deviation

The speed of the cylinwalls of the tube, just as a garden der may be computed to the ten thousandth part of a second if necessary Many files live first in the water as and the lineal distance run in that time Prince Bismarck, once trod on his larvae. Arranged along each side of be charted in perpendicular lines on their bodies is a series of exceedingly the inner side of the paper. At whatthin plates, late each of which runs a ever line the bullet penetrates outward second for the bullet to fly one foot its kaiser himself, would have been suf-

waited until the bird had passed him when, firing directly at it, he could

bring down his quarry. But it was not because the bird was not vulnerable, coming breast on. The fact was that it effw over his charge of shot. Before he could pull the trigger and the hammer fell on No local newspaper will refuse in, but did not take the bag off his to stand for and assert for the best back. "Won't you put down your bag. tried by the lifelong statterer. In a little and exploded, sending the shot was over-ome.

"That's fine," said a candid friend.

"Dat flown yards perhaps beyond its position when the fowler first touched "Now I wish you would take a bit of the trigger. But firing directly at the advice. You talk all right today, but bird after it had passed the shot just keep a watch on yourself and see charge had a strong tendency to drop as it flew, and the bird flying on a

level line "got in the way" of the Today the modern nitro powders are immensely quicker than was the old black gunpowder, yet it has been an engineering problem to determine just how fast and in what line a charge of the property of the prop how fast and in what line a charge of shot will travel. In this determina tion the revolving drum device has shown several important facts which eave been taken in connection with the speed of individual game birds and the effects of windage on a shot

That most important fact as to the flight of shot from a modern shotgun is that at forty yards the shot are "strung out" for approximately fifteen feet. While the leading pellets in the string have greatest velocity and kill-

"drifting" the charge, and out of these established facts to "lead" the bird sufficiently to kill it rather than maim and cripple it.—Marvin Holton in Chicago Tribune.

CASTORIA The Kind You Have Always Bought

They Are Produced by American Talent and Methods.

HARDEST TO COUNTERFEIT.

From the Time of Paul Revers, the First American Banknote Artist, Ours Have Been More Difficult to Imitate Than Those of the Old World.

To say that Americans make the best banknotes in the world may sound at first rather boastful, and yee any history of the art and industry of note engraving which failed to record that fact would be incomplete. Paul Revere was the first American banknote artist and from the time of the chartering of the Bank of North America under the direction of Robert Morris, in 1781, up to the present American engravers have excelled not only in the artistic quality of their designs, but in their provisious against counterfeiting.

Marco Polo found banknotes in China ages ago, printed on paper made from the bark of the mulberry tree. One of the notes upon which the great Venetian traveler himself may have him one cent stamps.-New York gazed is on exhibition at this day in the office of an American company. It is one of a series issued by the Ming dynasty about 1899 A. D.-"current anywhere under heaven"-and seems to have been printed from wooden blocks on a sheet of paper nine by thirteen inches, a bigger surface than any man could cover with both hands outstretched. It is good for "one string of eash." The provision against forgery is simple to the point of severity: "Counterfeiters hereof will be executed. Persons giving information of counterfeiters will be rewarded with taels 250 and in addition will receive the property belonging to the crimi nal.

Another great government has placed much dependence upon death as a deterrent to imitators of its promises to wrote "we were afraid they would of transferring designs from hardened abling the engraver to devote the time ciates went to London in 1819 at the instance of the British minister at Washington to help the Bank of England to issue notes not easily counterfelted. But the conservative old bank, refused to adopt the new method, preferring as one of the Americans said. to rely upon the hangman rather than the engraver. Nevertheless the English began in time to follow American methods after the geometric lathe had been invented by Asa Spencer of New London, Conn., and improved by Cyrus

The governments of continental Euope depend exclusively upon colo accepted by the bank without ques tion. A private concern now does the work. The Bank of Greece now uses the American method, having had sad experiences with notes of Austrian German and English fashioning.

A myth that probably will never die tells us that the notes of the Bank of England cannot be counterfeited. As a matter of fact, they can be imitated readily enough, for little attempt is made to protect the notes beyond the use of a watermark paper. The wa termark can be easily copied.

One practical safeguard of great ef fectiveness is the custom of the Bank of England to cancel every note that is returned to the bank and issue anoth er in its place. This and the practice of keeping a record of the numbers of all bank notes used in every business establishment keep alive a keen sense of responsibility which adds to secu rity. The custom of circulating soiled banknotes, of course, gives the coun terfeiter his best opportunity. Forgery is much more readily detected in crisp, stiff, new bill than in a rumpled and dirty one.

The American style of banknote has become the standard in the countries of Central and South America. The experience of the Brazilian governmen led the way in this after various dis appointments. First the much vaunt ed Austrian system was tried, the notes being engraved and printed in England under that system. The proved a complete failure. Counter feiters flourished. The Brazilians trie banknotes made in France, and thes were promptly and extensively imita ad as soon as the counterfeiters coul get their plates and paper ready. Bra all tried German and English establis ments, but still without securing pr tection to the banknote circulatio and at last turned to the United State and found a type of bills practically impossible to counterfeit. So it is no boast, but a mere record of fact, to state that Americans make the best banknotes in the world—Detroit News.
