

State College Answers Timely Farm Questions

Q. How soon can tobacco be harvested?

A. Harvesting should begin when the bottom leaves begin to turn yellow. The first leaves can be pulled a little greener than later primings, if the leaf is mature. Only uniform, ripe, well-developed leaves should be pulled as this uniformity in priming will add much to the quality. In normal seasons tobacco should be primed each week for best results. Proper care in handling the leaves so they will not break or bruise will pay dividends in a better quality and grade of the cured weed.

Q. How can I keep cream from spoiling between shipments?

A. Immediately after separating, place the can containing the cream in cold water so that the cream is below the surface of the water. The cream should be stirred occasionally to hasten cooling. Keep the container in cold water and in a storage place free from dust and odors until ready for market. Do not add warm cream to the cream that has been cooled as bacterial action of the cold cream will be stimulated and the quality of all the cream endangered. During the summer months the separator should be adjusted to deliver a 35 to 40 per cent cream as high test cream keeps in good condition longer than that with a low test.

For the Salad Enthusiast!

By BEULAH V. GILLASPIE
Director, Sealtest Laboratory Kitchen

Courtesy Sealtest Laboratory Kitchen

WARM days throw added emphasis on the salad course—and here are two proven suggestions which will satisfy the most exacting of salad epicures.

JELLIED BEET AND CHEESE SALAD

- 2 1/2 teaspoons gelatine
- 3/4 cup cold water
- 1 cup liquid from beets
- 1/2 teaspoon salt
- 2 1/2 tablespoons sugar
- 3/4 cup vinegar
- 2 cups diced cooked or canned beets
- 1 cup cottage cheese

Letting the gelatine over the cold water, add the hot beet liquid, and stir until the gelatine is dissolved. Stir in the salt, sugar and vinegar and add the beets. Add more salt if desired. Pour into a shallow pan and

allow to cool until ready to congeal. Dot with spoonfuls of cottage cheese placed so that when cut there will be one in each portion. Press down lightly. When firm cut in squares and serve on lettuce or other greens with mayonnaise or salad dressing. Serves six.

CHEESE VEGETABLE SALAD

- 1 cup cooked sliced carrots
- 1 cup cooked cut green beans
- 1 cup cooked peas
- French dressing
- Lettuce or other greens
- 3 large pimientos
- 1 cup cottage cheese

Mix the vegetables and marinate in the French dressing. Drain and place in a salad bowl or on a large platter lined with lettuce or other greens. Cut the pimiento cups in halves crosswise and place on the vegetables. Fill with the cottage cheese. Serves six.

WORLD'S SMALLEST?

Not much taller than the ordinary telephone he is using, Paul Del Rio, 19, claims to be the smallest man in the world. He was born in Madrid, Spain, weighs only 12 pounds, and is 19 inches tall. Except for his small stature, Paul is perfectly normal. He is touring the United States.

Young Chickens Need Sorehead Vaccination

Young pullets and cockerels should be vaccinated against chicken pox (sorehead) preferably when they are about 12 to 14 weeks old, advises C. F. Parrish, poultry spe-

cialist of the State college extension service. It is not necessary to vaccinate any old birds to be carried over.

However, the specialist recommended that the young stock be kept away from the old birds for at least 30 days after the vaccination. "It is best to keep vaccinated and unvaccinated stock separated at all times, and to keep young pullets and cockerels off ground ranged by older birds until the vaccination has had ample time to take effect," Parrish added.

Pullets which have already come into production should not be vaccinated, because it will upset their laying. Pullets should be vaccinated against pox at least 40 days before they come into production.

Parrish explained that the treatment is primarily for chicken pox, but that it also helps to control colds and roup which are common in poultry flocks in the summer. County farm agents are prepared to give detailed instructions as to vaccinating chickens.

The specialist also suggested that poultry flocks be dewormed, but said that this should not be done at the time the chickens are vaccinated for sorehead. "Wait at least three weeks after one of these operations before the other is started. To get results in deworming, a reliable product should be used according to the directions of the manufacturer, and the birds should be transferred to clean range about the second day after treatment. If a flock is to be dewormed, do the job at least six weeks before the birds are due to come into production."

Soybeans Suitable As Feed For Lambs

Although soybeans will produce "soft pork" if fed to fattening hogs, they are a desirable feed for lambs and will not affect the quality of the carcass, reports Dr. John E. Foster, associate professor of the State college animal husbandry department. "In fact," he said, "we have found in our experimental work on the State college farm that ewes and lambs gain faster on soybean pasture than on any other kind."

With soybean production up nearly 10 times what it was 10 years ago, both farmers and scientists are looking for new and

profitable uses for this soil-improving crop.

"We have fed up to three-fourths of a pound of soybeans per day to sheep with good results," Dr. Foster stated. "Soybean oil meal is an excellent protein supplement for sheep, cattle, and even swine. It is the whole beans fed to hogs after they reach 75 to 100 pounds in weight that produces 'soft and oily pork' which is undesirable."

Dr. Foster cited results of experiments conducted by the U. S. department of agriculture at the agricultural research center, Beltsville, Md., to support the investigations of the State college experiment station.

Three lots of lambs were fed at Beltsville. One group received the usual ration of cracked corn, cottonseed meal, and alfalfa hay. The second lot received only cracked soybeans and alfalfa hay. The third lot received a ration of equal parts of cracked soybeans and cracked corn, with alfalfa hay.

Lambs in each lot averaged more than a third of a pound a day in grain while on feed. Most lamb feeders are satisfied with this daily grain.

IMPROVEMENT

Some improvement this summer and fall in the general business situation and demand for farm products is predicted by the U. S. bureau of agricultural economics.

National Forest Timber for Sale

Sealed bids will be received by the Regional Forester up to and including July 13, 1939 for all the live timber marked or designated for cutting, and all merchantable dead timber located on two areas embracing about 3,913 acres within

LEGAL ADVERTISING

White Oak Creek and Wine Springs drainages, Nantahala River Watershed, Macon County, Nantahala National Forest, North Carolina. The White Oak Creek Compartment includes approximately 2,907 acres and is estimated to contain 8,772 M feet, more or less, of yellow poplar, black cherry, northern red oak, ash, cucumber, basswood, white oak, black oak, chestnut oak, birch, sugar maple, red maple, scarlet oak, hemlock, buckeye, beech, and chestnut, and an estimated amount of hickory, black gum, silverbell sawtimber, chestnut extractwood, and chestnut oak and hemlock tanbark. The Wine Springs Compartment includes approximately 1,006 acres and is estimated to contain 3,261 M feet, more or less, of yellow poplar, black cherry, northern red oak, cucumber, sugar maple, white oak, red maple, black oak, scarlet oak, chestnut oak, basswood, white ash, birch, hemlock, buckeye, beech, and chestnut, and an unestimated amount of hickory, black gum, silverbell sawtimber, chestnut extractwood, and chestnut oak and hemlock tanbark. The removal of extractwood, tanbark, and hickory, black gum, and silverbell sawtimber on both compartments will be optional with the purchaser. The timber on an additional 804 acres in the White Oak Creek Compartment and 484 acres in the Wine Springs Compartment, carrying a comparatively light stand, may be cut at the option of the purchaser. No bid of less than \$8 per M for yellow poplar; \$7 per M for northern red oak, cucumber, basswood, black cherry, ash, and sugar maple; \$6 per M for white oak; \$3 per M for birch and red maple; \$2 per M for chestnut oak and black oak; \$1 per M for chestnut, scarlet oak, hemlock, hickory, buckeye, beech, black gum, and silverbell; \$0.50 per unit (160 cubic feet per unit) for extractwood; and \$1.50 per ton (2,000 pounds) for tanbark will be considered. In addition to the price bid for stumpage, a deposit of \$0.10 per thousand feet for all timber cut will be required for sale area betterment work. \$2,000 must be deposited with each bid to be applied on the purchase price, refunded, or retained in part as liquidated damages according to the conditions of the sale. The right to reject any and all bids is reserved. Before bids are submitted, full information concerning the timber, the conditions of the sale, and the submission of bids should be obtained from the Forest Supervisor, Franklin, North Carolina.
