

Rowell Gives Control For Weevils In Wheat

Practical control of grain weevils in stored wheat can be obtained readily and inexpensively through the use of carbon disulphide, advises J. O. Rowell, entomologist of the State college extension service.

Before the grain is stored, the bins should be cleaned thoroughly, accumulations of all old grain removed, and the woodwork treated with any odorless, tasteless, water-white petroleum similar to that contained in commercial fly sprays. Walls and floors should be sprayed thoroughly with this substance.

The accumulations of old grain and floor sweepings from the previous crop should be burned, or, if it is to be used as feed, the grain should be treated with carbon disulphide.

Sweepings may be placed in a tight bin or barrel and the chemical poured directly over it, using the fluid at the rate of about three-fourths of a pint to a barrel of the sweepings. The container should be covered immediately with a double thickness of wrapping paper and tied securely around the top. In order that the fumes may penetrate thoroughly, the container should be left sealed for at least 24 hours. New grain may be treated in the same way.

However, Rowell warned, carbon disulphide is highly inflammable and should be used with extreme care. Fire of any kind, excessive heat, or frictional or static electricity should not be allowed near the containers being fumigated with this chemical.

Although carbon disulphide has a repulsive odor, it will not linger on the treated grain after the wheat is aired. Since the gas it forms is heavier than air, it can be poured directly on top of the grain, and the fumes will penetrate to the bottom of the bin.

Unquestioned Quality
Well informed people give thoughtful consideration to the quality of funeral service that is to cross the thresholds of their homes. In our mortuary, an experienced staff, trained in the ways of human helpfulness, minister to every wish and need of bereaved families. Such services of high excellence need cost no more than funerals erroneously believed to be less expensive.

State College Answers Timely Farm Questions

Q. How can I tell if my dairy cow is getting sufficient feed for maximum production?

A. Feed the animal all the roughage, including hay and silage, she will consume and then gradually increase the grain ration. Check the milk sheets carefully each day and, if milk production increases with the increase in grain, continue to increase the grain until the milk production ceases to be profitable. The grain ration is fed in proportion to the milk production and if no increase is made with the increase in grain fed then the original feeding was sufficient and should be continued on that basis.

Q. When should fall gardens be planted?

A. This depends upon the hardness of the different vegetables and upon the time required for maturity. Tender vegetables should be planted in time to produce a crop before killing frosts occur. Many of the cool-season crops will grow and mature a crop through light frosts, but they should be planted in time to mature before the hard frosts occur. A planting table is given in Extension Circular 122, "The Farm and Home Garden Manual" and copies may be secured free upon application to the Agricultural Editor, State College.

Q. Does moist mash have any effect upon egg production?

A. Yes, moist mash will hasten egg production in the fall when fed to late-hatched pullets and will also keep up production in laying hens from June until October. The best time to feed this mash is at 2 p. m. each day. Three pounds of the regular laying mash moistened with hot water or milk, preferably milk, for each 100 birds will give excellent results. This mash increases the animal protein consumption and produces an appetizing effect upon the birds at a time when production is subnormal.

DAMAGE

A recent rain and wind storm did considerable damage to Anson county crops, blowing down young corn and inflicting serious injury to other crops, reports Assistant Farm Agent Clarence Early.

WAGES

Wage rates to agricultural workers increased slightly less than usual during the April-June quarter of this year, and the July wage index was the lowest for the month in three years.
