## FIVE FERTILIZER MIXTURES FOR GROWING GOOD CORN

Since corn does not sell for a high price per bushel, the grower should buy and use fertilizer carefully for the crop. Prof. C. B. Williams, head of the department of agronomy at State College, advises that not over 300 to 400 pounds of fertilizer be used on the average soils of the state and he has worked out some five mixtures that could be made at home and used to advantage.

For the coastal plain soils, the first mixture is as follows: 940 pounds of 16 percent acid phosphate, 490 pounds of 7 percent cottonseed meal, 190 pounds of 18 percent nitrate of soda and 389 pounds of 12 percent kainit. This mixture is for sandy soils. Half the nitrogen should be applied at planting and the other half applied as nitrate of soda when the corn is from knee to waist high.

A second mixture is 680 pounds of acid phosphate, 775 pounds of cottonseed meal, 300 pounds of nitrate of soda and 245 pounds of kainit. The entire application of 300 to 400 pounds may be applied at planting or part or all of the nitrate of soda reserved for use as a topdresser.

A third mixture is made by using

843 pounds of acid phosphate, 470 pounds of fish scrap, 310 pounds of nitrate of soda and 375 pounds of kainit.

For the piedmont or mountain soils, Prof. Williams gives two good mixtures both of which should be applied at the rate of 300 to 400 pounds per acre. These are, first, 1060 pounds of acid phosphate, 320 pounds of cottonseed meal, 370 pounds of nitrate of soda and 250 pounds of kainit. The second mixture is made by using 1200 pounds of acid phosphate, 500 pounds of nitrate of soda and 300 pounds of kainit. These mixtures harden rather quickly upon standing and should be applied immediately after preparation.
