

You WEED Your CROPS Why Not Your TIMBER?

Only weed trees with white spots will be cut.

Dead trees on ground were weed trees and should have been cut for pulpwood. They died due to lack of growing space.

Weed trees are trees undesirable because they retard the growth of a nearby, better tree.

Same timber after weed trees only were cut. If protected from fire, the trees left will grow into poles, sawlogs, and more pulpwood.

Timber grows faster after weed trees have been cut for pulpwood.

Permit Us to Estimate the Value of Your Weed Trees—Both Pine and Hardwood

Your timberland is a valuable asset, and your pine and hardwood forest lands can be developed into a steady source of income—with the market open every working day of the year. Selective cutting and protection of your lands from fires are very important, and we will assist you with advice on these matters, in addition to assuring you a fair price and steady demand for your pine and hardwood pulpwood at all times.
