THE PENNIES IN THE BOX.

I'm Uncle Sam's most favored pet I'm hearty and I'm hale: I've nothing in this world to do But glide 'round with the mail; But one thing almost breaks my heart, And my nervous system shocks; It's the everlasting pennies That I'm fishing from the box.

I carry stamps and envelopes, And postal cards and such; And I would like to sell a few-Twould please me very much; But a man can't sell unless you buy, No matter how he talks: So I have to keep on diving After the pennies in the box.

It's all right in the springtime, Or when summer breezes blow; But a different proposition When it's thirty-two below: ; When all your fingers and your toes Are frozen hard as rocks, It's most anything but funny Scratching pennies from the box.

And now, quite confidentally, I'll tell you something more; A rural carrier (way out west) Forgot himself and swore; Says he, "I can stand the snow drift; I can stand the frozen locks, But blast the measley pennies In the blasted measley box."

When "the roll is called up younder" And we all shall gather there, They wouldn't let a mail man in If they knew he'd learned to swear, If you want St. Peter to open the gate Buy stamps and don't be guilty Of putting pennies in the box.

SUGGESTIONS FOR THE UP-TO-DATE

Tobacco For Porses.

A horseman says he has cured horses and colts of worms by pulverizing tobacco leaves with his hands and placing a small quantity in each feed of shelled oats for a few days. He says the worms will be expelled without any Ill effects to either the horse or colt. Colts will soon learn to like the tobacco and eat it freely. He says that many a colt that is now kept poor and scrawny by the worms, if given pulverized tobacco leaves in this manner, will soon begin to thrive and take on flesh.-Epitomist.

Poultry For Market.

When scalding poultry for market, it is best to first dry pick the legs, so that they will not necessarily be placed in the water and change color. Neither the heads nor the feet should touch the water. The water ought to be as near the boiling point as possible, without boiling.

The way to "plump" a drested fowl is to dip it for ten seconds in water nearly or quite boiling hot, and then immediately in cold water. Hang in a cool place until the animal heat is entirely out. Plumping gives the fowl a much more attractive appearance.

A duck is not fully matured until it is about two and a half years old .-American Cultivator.

Don't Mix Grit in Food. E. C. Dow, a poultry expert of Maine,

says on the subject of food:

"One of the most common of the various wise sayings of some poultry teachers is that the first feed to the newly hatched chicks should be grit in the form of fine sand or some similar substance; but this advice is always qualified by the caution not to mix the grit with the food, as to do so means sickness and loss by bowel trouble. If grit cannot be safely mixed with the food and fed, even in small quantities, why feed it at all? We feed the hens grit by keeping a supp'y where they can help themselves. At the same time it works no injury to the mature fowls if the grit is mixed with the mash, provided it is not used in excess; but since it is not possible to tell what the hen needs to regulate digestion it is wise to let her help herself. The gizzard of the chick is free from sand or grit, and should remain free until old enough to begin to grind its own food. That is usually at the age of ten days. Before that they should be fed on food which can be digested without the aid of grit."

Accounts With Each Cow.

The Connecticut station suggests that accounts be kept with cows to see whether they are profitable boarders, or not, crediting each cow with all the milk given by it, put at the local market price for milk. Measure the milk by weight, reduce this to quarts by dividing by 2.15 and then multiply by the price per quart. Credit her with \$2 for the value of the calf and \$19 for the value of the manure. This will make the total credits, except the p ofit you make in selling her, the feed you have raised on the farm, as shown by the difference between its actual cost and the market price. Charge the cow with the cost of feed at market rates and the following fixed charges: Bed ding for one year \$2, service of built \$1, labor \$27, interest on investment \$6, taxes 60 cents, insurance 4) co-ta depreciation \$8. Total \$45. In figuring the interest on investment the cow is given a value of \$60 and her share of the value of the barn, too's and other equipment is placed at the same figure. Five percent on \$120 is \$6. In figuring the labor item, it is estimated that one man, receiving a salary of \$45 per month, could do all the necessary work in the eare of twenty cows and the marketing of their product. This would make the labor item \$27 per cow.-Weekly Witness.

Silo Construction.

A Canadian feeder of large experience, has this to say on silo const uction in one of our Canadian exchanges; Do not on any consideration build a square or obiong silo. The walls of such a silo are not strong enough to stand the pressure caused by the great weight of the sllage; and the amount of clinge lost in the corners will amount, in a few years, to a considerable value. The best chape is circular. A sllo should be more than twice as high as it is wide. Do not build a silo teo large in diameter as the amount of slinge spoiled from day to day will more than pay the interest on the cost of an extra smaller cae. The main qualities of a silv are that the walls shall be strong enough to withstand the pressure and it shall be sit I time. There is no comfort for the tight. To get this, the first sie; is to built a good solld foundation, commenced below the I cat line.

Perhaps the simplest and costent He governs best who governs least style of silo to be built is the stave sile. It should be made from two inch narrow plank properly beyeled, and held together by strong iron bands. The staves, after bevelling so that when fitted together they will form a circle of the desired size, are placed on end, on a solid foundation and prorerly fitted. These are strengthened and held in place by strong iron hoons which are so made that they may be

tightened or loosened at will. Doors should be built at intervals from the top to the bottom to that the silage may easily be got out. It is not necessary to put a roof on this sile, but it is much to be preferred. This style of the silo should be kept well painted,

Arsenate As Insecticide.

able, rigid and air-tight.

both inside and out. If properly built

and taken care of a stave silo is dur-

Many gardeners and fruitmen advise the use of paris green in connection with Bordeaux for trees, potatoes, etc. After using paris green and also arsenate of lead in conjunction with Bordeaux some have found that it was very difficult to get just the right amount of paris green, as a little too much will kill the foliage and only a slight amount less will fail to kill the bugs. With arsenate of lead one does not seem to damage the foliage, however much is used, and it sticks better to the leaves.

Both of these poisons are excellent insecticides, each possessing certain advantages. Faris green is cheaper, as far as poisoning qualities are concerned, and is also more rapid in action than the argenate of lead, and hence is preferable where hordes of insects are inflicting great daily losses. Experts generally advise the use of paris green wherever immediate results are desired, and when Bordeaux mixture is used with this poison there is a good chance of its remaining on the foliage

for a little while at least. On the other hand, arsenate of lead though slowed in action and more costly, is very adhesive and is specially useful wherever it is desired to protect the foliage from leaf feeders during a considerable time, and particularly where there is no pressing need of immediate results. Furthermore, arsenate of lead can be used in almost unlimited quantities without injury to the foliage, something which is not true of paris green. Some advocates of arsenate of lead advise its use in very large quantities where immediate results prost be obtained and the wisdom of following this course must be determined largely by local conditions since the cost is considerably

Some growers of potatoes have experienced difficulty in killing potato beetles with arsenate of lead applied with certain horse sprayers. This trouble is due to the fact that certain machines make a small amount of water go a great way, and, as a consequence, unless the poison is very concentrated form there will not be a sufficient quantity on the foliage. It is simply a question of adjusting to conditions whether one or the other is employed. Both have their advocates and both are exceedingly useful when properly applied.-Indianarolis

Dairy Notes.

The successful butter makers have carned that creater care and cleanliness is necessary in the handling of and owner during the hot days of the summer. At this time milk ! the most perishable product of the calves out in the hot sun these days

I know a few farmers who turn the calves out in the hot sun these days with the termenting flies. Is it not kinder and more profitable to keep them in a clean, dry, well-ventilate1 bex stall during the day and turn them out at night where they can be comfortable?

Raise your own cows, is good advice but we must be sure the calves are worth raising. If it is butter we want the calves must have within them the promise of dairy possibilities. Don't forget as the calf is treated so will the cow be. The calf must be handled properly if we would have a quiet gentle cow. Bad habits come through wone treatment every time,

Cows that are not well supplied with water will fall off in milk. When they gre allowed to fall off for any length of time the milk-secreting glands shrink, then no after needing or care will bring them back to their full milk flow until they are fresh again.

Do not use artificial means to prevent the flies, great swa-ms of them, from werrying the cown? We have not tried the commercial preparations but we find many of the home applications which are recom mended, do the work well, are cheep and early to apply, Though they are thort-lived we would rather take the little time required to apply them "equently then to have the coles falling off in flesh and milk production from fighting files and bending comething to est at the same cows in the masters at this reason unlove they can be free from the torprests of the fly.

Traca is an off-cont remode that does pot need renewing in as short a time as some other we have tried. Try it and ser how rulckly flies get off when they Heht on the cow's back and shoulders: One quart of old grease or lard, one quart of kerosone, and a big tablesreconful each of fish oil, carbolic acid and oil of pernyroval. Apply with a sponge, or much better a sprayer made for the suppose - Panny M. Wood, In the Indiana Farmer.

Silence!

The instinct of modesty natural to every woman is often a great hindrance to the cure of womanly diseases. Women shrink from the personal questions of the local physician which seem indelicate. The thought of examination is obhorrent to them, and so they endure in silence a condition of disease which surely progresses from bad to worse.

It has been Dr. Pierce's privilege to cure a great many women who have found a relate for modesty in his offer of FREE consultation by letter. All correspondence is held as sacredly confidential. Address Dr. E. V. Plerce, Buffalo, N. Y.

Dr. Pierce's Favorite Prescription restores and regulates the womanly functions, abolishes pain and builds up and puts the finishing touch of health on every went woman who gives it a fair trial.

It's sold everywhere in three size bottles \$1.00, 50c, 25c

Unselved Problems.

Aerostatic artists are on the verge of many things to learn. It is perfeetly evident that if they could establish the fact that an aerostation balancing wheel, in the way of gyroscopic attachment, should burn upon the ends of the wings, which it is the present endeavor and apparent necessity of plane builders to make, there might be a grand accomplishment achieved, which at this time the ordinary mechanician seems unable to solve.
