DAIRY THE DAIRY

Best Plan to Get Good Cows Is to Raise Them

Profitable dairy cows may be secured in two ways. First, they may be purchased. This is, no doubt, the most expensive way, but necessary in many cases in order to get a start. In purchasing cows you take chances on getting individuals not as good as they look, for often the best judges of dairy animals are fooled in the value of cows. Then, also, there is the chance of bringing in diseases such as tuberculosis, contagious abortion, and udder troubles, says J. P. LaMaster, chief of the dairy division of Clemson college. The second and best way to get good profitable cows is to raise them on your farm. All dairy cows depend for their value on the inherent tendency to convert feed into milk and on their proper growth and development. That is, they must have well-bred ancestry. Although the cows you now own may be grades and poor grades at that, you can insure the value of your future herd by breeding these cows to well-bred pure bred bulls.

A well-bred bull is not only a registered bull, but one having a sire coming from a line of high butterfat and milk producers, and out of a dam with a good butterfat record, nothing less than 400 pounds in one year, she also having come from a line of high producing ancestry.

The tendency of the normal cow is to revert to the original wild cow which gave only enough milk for her calf; so unless by selection you increase the ability to produce, you will soon have only boarder cows which will not pay you for the feed they eat or the labor necessary to manage them.

The most profitable system of dairy farming is to have the most of the cows fresh in the fall. In order to do this it is necessary to breed the cows during November, December and January. If you do not have a good bull or do not live near a farmer who owns a good bull to which you can breed your cows, begin now to locate one for your own use. The dairy division of Clemson college will assist you in locating a good bull.

Plan Outlined to Avoid Grassy Flavor in Milk

When the herd is first placed on pasture or is turned into clover or alfalfa, a grassy taste is often caused in the milk for a short time, not only making the milk objectionable to trade, but affecting the butter taste as well. This can usually be eliminated by starting the herd on a change of pasture, or a pasture from confinement, gradually.

Do not leave the herd on the new pasture too long the first day—a few hours in the morning or afternoon, supplementing this with some grain and a dry roughage such as silage. The silage can best be saved during the time of good pasture, after the cows have gradually been allowed more time in the pasture, as it will make a good supplement for poor pastures later in the summer. After a week or ten days, cows producing twenty pounds of milk a day or less will need little if any grain on good pasture. For heavier producers, feed a pound of grain for each six or eight pounds of milk produced per day. A mixture of 400 pounds of ground corn, 200 pounds ground oats, or bran, and 100 pounds of cotton seed meal is recommended by the Purdue dairy department. Cottonseed meal is especially good at this time, to produce a firm butter with better quality, as well as to tend to check the laxative effects of a fresh pasture. A liberal supply of salt should be available to herds on pasture at all times.

Ohio Cow Makes Record of Five Sets of Twins

The Ohio Station Bulletin 7 makes note of a cow in the station herd that is reported to have dropped five sets of twins out of seven times calving. Twinning has also been rather common in other closely related cows in the herd. The possibility of establishing a family of cows which would produce a high percentage of twins is suggested, but it is pointed out that of the nine sets of twins recorded six sets were male and freemartin and three were males.

Good Cows Will Always Pay Biggest Dividend

Just because a poor milk-producing cow pays you a return, do not conclude that scrubs pay. This is an unusually productive year for dairy cows, and with cheap feed you should make money on any sort of animal. Good cows will pay you a still greater return.

Watch Cream Separator to Conserve Butterfat

Many farmers are losing considerable butterfat because their separators fail to skim clean, say dairy experts at Iowa State college. Reports received from over the state show that skim milk often has from one-sixth to one-fourth per cent fat in it. This could be saved by adjusting the cream screw on the separator. Cream that tests high will keep longer and grade higher than that which contains considerable skim milk.

MERCHANT UNTIED HARD KNOT

Judgment of a Modern Solomon That Proved of Some Benefit to the Red Cross.

The Milwaukee chapter gained \$5, due to the fact that Nichetas Beltosos is a diplomat as well as a peacemaker and philanthropist.

One day two women entered his store and as they were leaving the shop "Nic" noticed a \$5 bill on the floor," says the Red Cross Courier. "Did either of the ladies lose it?" he asked. "They did," the ladies agreed.

They were uncertain at first, but as their certainty increased Nic's perplexity did likewise.

"There are three ways to settle this," he said. "We can tear the bill in two and give each of you half, which would be foolish. I could keep it myself, which would be wrong. Since you can't have it, and I can't have it, let's give it to the Red Cross."

Imported Joke.
