PIGS IN 3 LITTERS

Jess Thomas is proud of a sow he owns. He reports that her last three litters have totaled 40 pigs. Thirteen pigs came in each of the first two litters, and 14 in a litter that has just been born. Nine pigs each were raised from

ENGINEERING ON FARMS IS IMPORTANT MATTER

SERIES IS BEGUN

Farmers Are Urged To See standing of what they see. Possibilities In Things

METHODS SUGGESTED

Permanent Homes Is One Of Many Needs In Country

(By Elmo G. Harris)

Editorial Note: Elmo G. Harris, an uncle of Lyles Harris, and professor of hydraulic engineering in the University of Missouri, has prepared a book on engineering problems that come to the attention of farmers. The book has not yet been published, but is being printed in full in The Press. After the series is ended, readers will have the contents of a complete book, provided the articles are preserved.

That the reader may be sure that the author knows what he is writing about, he is informed that the author was a farmer boy. It was by sweat of the body, aching back, weary limbs and disappointed hopes that he became impressed with the need of more attention to, and better solutions of, the simple problems in engineering that the farmer should recognize, study and solve. Throughout the author's 30 years as a civil engineer he has never lost sympathy for the farmer in his struggles nor ceased to take an intense interest in every step and more for betterment of conditions on the farm and about the country home.

The profession and practice of civil engineering trains one to utilize the resources of nature and develops an alertness to see possibilities that the untrained would not detect; and to see blunders and neglected opportunities where a casual observer would be seeing other things.

Costly Blunders

has led him to believe that such mat- of the work.

Now every sign reads that the farmer is again coming into his own. With the exercise of judgment and industry his future is more secure than that of any other man. Then is he not justified in building his home with the intent of spending his life there-and this being so. is it not the course of wisdom that he should build with such materials, at such places, and in such ways, that it will not need to be done again in his life time?

Probably one of the most deplorable (Continued on page four)
