Jay Walker to Blame for Half of the Deaths by Auto

MANY a motorist whose car has figured in a fatal accident will be able to present a clear sheet to Saint Peter when his time comes, when one considers all the contributing factors outside of the driver's own fault. A total of 1,390 auto fatalities on record with the Stewart-Warner Safety Council for the prevention of automobile accidents, covering a period of seven months, shows that in 727 cases the fault was clearly the pedestrian's and cannot be put down to the driver, the weather or unavoidable circumstances.

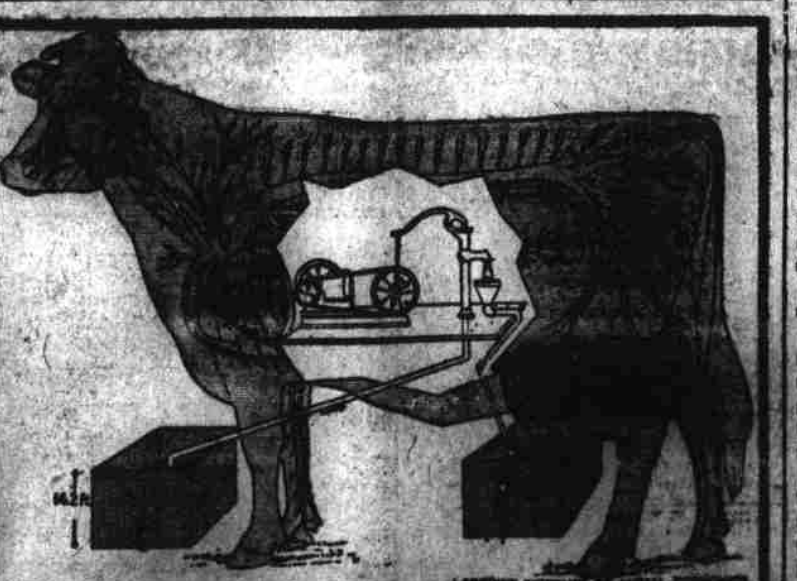

Uncle Sam and His Nephews, the States, Are Collecting Over a Billion Dollars in Yearly Tolls on Motor Vehicles and Fuel

More Than Meets the Nation's Billion Dollar Highway Building Bill—Thomas H. MacDonald, Chief of the U. S. Bureau of Public Roads, Tells Striking Details.

By JUDSON C. WELLS
America has reverted to the ancient system of collecting tolls wherewith to build and maintain highways. In 1925 these tolls amounted to \$1,094,000,000, collected through motor licenses, gasoline taxes, property, corporation, income production and other taxes on automobiles, automobile manufactures, the petroleum industry, etc.

Cows Heart Pumps 21,600 Gallons of Blood Every Day

MORE than 21,000 gallons of blood—enough to fill a tank 14 feet square and 13 feet high—are pumped through the average cow's heart in twenty-four hours, according to the Lawrence Institute of Animal Economics. Twenty to forty seconds are required for the blood to make a complete circuit of the main circulatory system.

ALONG LIFE'S TRAIL

By THOMAS ARKLE CLARK Dean of Men, University of Illinois.

UNCERTAINTY

THE apartment which Nancy and I had in New Orleans last winter was rather inadequately heated. It is true there was a radiator in one corner of the living room, but it was an easy-going Southern radiator that seldom got down to business.

There was a fireplace in addition to the chimney radiator, and this last was attended to in a desultory way by an old negro, who stumbled into the room at long intervals, as a purveyor of fuel. There was a bell in the room with the legend over the push button, "Ring if you wish fuel," but there was no indication that any such desires would be gratified.

"Bring up some coal, George," I said to the African whom I chanced to meet in the hall. "It's as cold as a barn in our room."

"Yes, sah," he answered obsequiously, but he did not arrive, though I waited a considerable time. I should have gotten it myself had I known where they kept it. We came to realize that there was considerable uncertainty about George's movements.

I heard him at the telephone one evening. From the monotone which came to my ears I inferred that he had an engagement, that the person at the other end was concerned as to whether or not the date was going to be kept, and George was desirous of leaving the impression that he was intending to meet his social obligation and yet was trying to find a hole to crawl out should later events make it seem desirable.

Uncertainty was George's philosophy of life.

Claude was a very effective speaker and writer. He had a ready pen, and a powerful deep voice, and when he got on his feet, or really settled down to write, he always had something to say. The trouble was to get him on his feet, or to have him settle down. There was no difficulty in getting him to promise, "Will you speak for us at the convention?" the chairman of the program committee would ask. "It's important, and we want to be sure that we can count on you." And Claude would always promise. Then at the last minute, when it was almost impossible to get anyone adequately to fill his place, there would come a telegram giving some trifling reason why he could not meet his engagement. Sometimes he didn't even explain. We came to understand that when Claude agreed to do anything, "likely he would and likely he wouldn't," and usually he didn't.

It was the uncertainty of his reliability that ruined him.

MEASLES

The specific virus causing measles has not yet been isolated but it has been conclusively proven that the causative organism is "filterable" and will pass through an exceedingly fine filter. It is found to be present in the secretions from the nose and pharynx twenty-four hours before the appearance of the rash and to remain present a day or two after the rash disappears.

Measles is perhaps the most easily transmissible of all the contagious diseases and is contagious from the beginning of the first catarrhal symptoms throughout the duration of the rash. The most incubation period is the first twenty-four hours of the rash. One attack produces an immunity which in nearly all cases is permanent.

The disease is transmitted either directly by droplet spray in sneezing, coughing or talking or indirectly through objects freshly contaminated by such secretions. Outside the human body, the virus does not live long and contaminated objects under ordinary conditions are a menace for a period not exceeding twenty-four hours.

Persons of all ages who have never had measles are susceptible but the age of greatest incidence is about six or seven years. Deaths from measles, however, are in young children, 66 per cent under two years and 90 per cent under five years of age.

Measles at first appears very much like a common cold except the child is somewhat sicker than would be expected. If a child is sick with an apparently severe cold and has a temperature of 101 degrees, measles must be considered, especially if the eyes are red and watery and there is a severe cough. An apparent improvement in the child's condition frequently happens just preceding the appearance of the rash. The greatest danger from measles, especially in the older children, is from the complications. These are of two general types, (1) invasion of the upper respiratory tract causing pneumonia, otitis, mastoiditis and meningitis, and, (2) disturbances of the alimentary tract causing diarrhoea, enteritis and dysentery.

No method of vaccination has yet been perfected but the use of convalescent serum has proven very helpful.
