Sunday guests of Mr. and Mrs. T. R. Quinn were Mr. and Mrs. Allen Quinn and baby of Beulaville and Mr. and Mrs. Jesse Bell and family of Turkey.

Tree Swallow

The swallows are a group of birds about which it is easy to write in superlatives. The swallows of El Capistrano manage to hit the front pages of newspapers across the continent each spring. We have the saying that one swallow does not make a spring and if you happen to be in a barn or around a boat house when Barn Swallows are building their nests, you are likely to get a new interpretation of what is meant by "here's mud in your eye."

Tree Swallows congregate in great numbers, usually in marshes, just prior to the southern fall migration. One day they are in an area in abundance; the next day they are gone. There was a time when people believed that they vanished because the swallows turned into frogs only to reverse the process in the spring. Since the Tree Swallows may well be the first swallow to arrive in the spring they may be responsible for the saying that one swallow does not make a spring.

Tree Swallows are relatively easily recognized because of their immaculately under parts and their steely-black or greenish-black backs. Their tails are forked but not so deeply as is the case in the Barn Swallows and Purple Martins. The length of the Tree Swallow is about 6-1/2 inches; of a Cliff Swallow, 8 inches; and of a Purple Martin, 11 1/2 inches. In comparison, therefore, the Tree Swallow may be considered a relatively small swallow.

Tree Swallows breed from northwestern Alaska to southern California and east to north Quebec and Virginia. They winter from central California to North Carolina and south to Honduras, Mexico and Cuba, these limits being general rather than specific. During the winter while the birds are south, the young birds of the year are more grayish than blue and the

There is not clear white so attractive to the mature birds.

Tree Swallows nest readily in bird boxes or in tree cavities. A nesting colony may be of considerable size. The nest has a green lining and is abundantly supplied with feathers. The 4 to 10 ivory-white eggs are approximately 4-8 by 5-10 inches in size and are incubated for 2 weeks. Two broods may be raised in a season and two females may occupy the same nest, all of which should lead to interesting interpretations of the family life.

Tree Swallows are great insect eaters but they eat more than food. They are known to feed on the berries of the Virginia creeper and the fruits of wild cedar. They are probably almost as valuable in an agricultural sense as are the Barn Swallows. Their beauty to the eye is such as to place them in top rank but beauty is a variable asset fortunately and there are those who can justify dis-

ing interpretations of the family life.
