Cpl. Cameron West Will Take Course.

Cpl. Cameron West, physical instructor, has been ordered to Non-Commissioned Officers School at Miami Beach, Fla., where he will take a course in Physical Training.

Upon a satisfactory completion of the course, he will be promoted to Staff Sergeant and returned to duty with the Athletic Department here.

Cpl. West enlisted in the Army Air Corps in September and was transferred to this post a month later. He is a 1942 graduate of the University of North Carolina where he received a bachelor's degree in physical education. The son of Mr. and Mrs. Ray West of Walstonburg, he is proficient in baseball, wrestling, track and basket ball.

He is married to the former Miss Florence Grace Creech of Snow Hill, N. C.

STATE COLLEGE ANSWERS TIMELY FARM QUESTIONS

QUESTION: Should I use my land to plant my full allotment of cotton this year?

ANSWER: "Yes," advises Director I. O. Schaub of the State College Extension Service. Food and feed crops are most important under war conditions but cotton is food, feed and fighting equipment. A bale of cotton provides about 500 pounds of fiber, 140 pounds of high grade vegetable oil for food, 408 pounds of protein meal and cake for livestock, 240 pounds of hulls for livestock roughage and chemical uses, and 31 pounds of lint for smokeless powder, plastics and other essential products.

QUESTION: When should I move my chickens to summer range shelters?

ANSWER: "At 8 to 12 weeks of age, when the birds are fully feathered," says R. S. Desmetz, head of the Poultry Department at N. C. State College. These shelters are set on a sled runner type, boxed in, wire floored bases, so that they can be moved easily. When changing the shelter, clean up all droppings and remove at least one inch of top soil. Do not put shelter where it will receive drainage from the old location.

QUESTION: How often do you advise cultivating tobacco?

ANSWER: About a week for ten days after transplanting, cultivate the crop with a small cultivator. Following this, it should be cultivated every week or ten days up to about a week prior to topping. At each cultivation, the soil should be thoroughly broken and the middle row, care being taken not to disturb the root system when sifting. Keep the tobacco as much as possible with neat cultivation.

FRUGICIDES

There are many reasons why frugicides are so important in the control of insect pests and diseases on fruit crops. These frugicides are not only effective against insects but also against diseases. They are also very important for the control of insects and diseases on fruit crops.

OFFICIAL TABLE OF CONSUMER POINT VALUES FOR MEAT, FATS, FISH, AND CHEESE

Sailing Ship On Mercy Mission With Prisoners Of War Packages

Washington, D. C.—Resident of the clipper ships of old was this four-masted bark when she cleared an American port early in April with a cargo of 281,000 American Red Cross prisoners of war food parcels. Checking the boxes are Mrs. I. Evelyn Miller, Miss Rosalind White, and Mrs. Worth...

What You Buy With WAR BONDS

The farmers of the nation, however, can start now buying rural electrification and all the equipment which goes with it through purchase of War Bonds. Your War Bonds today will buy rural electrification equipment, and give you back \$4 for every \$5 you invest.

New Appeal Is Made For More War Crops

The nation's urgent need for food and fiber crops to fill wartime requirements this year makes it essential that farmers plant to the full limit of their capacity before the spring planting season is over, according to G. T. Scott, chairman of the State USDA War Board.

This year is probably the most critical year in the history of American agriculture, Scott said. "War-time needs for food have grown steadily for the past two years, and it is estimated military and Lend-Lease purchases will take about one-fourth of the 1943 farm output. Demands for food vary greatly from time to time, and each new offensive by the United Nations means more food is necessary. We who grow this food must meet our production goals if we expect our fighters and war workers to meet theirs."

More Efficiency Needed In Poultry Management

Since there is a critical shortage of animal and vegetable proteins for poultry feeding, T. T. Brown, Extension Poultry Specialist at N. C. State College, urges farmers and poultrymen to take immediate steps to prevent waste of feed and to practice the highest degree of efficiency in their poultry management.

Growers should produce the greatest amount of poultry and eggs possible from the amount of precious feed available. This calls for better methods of handling the poultry and Brown makes the following suggestions for increasing this efficiency.

Don't overcrowd the chicks. Overcrowding not only causes many deaths but also results in slow growth and development. Thus, chicks, feed and labor are wasted.

Use large enough feeders for each state of growth of the chicks and don't overfill the feeders, as such practice causes feed waste.

Keep the chicks as free of worms and Coccidiosis as possible through sanitary management, summer shelters, green food, and worm treatment.

Keep dogs and rats from the feeders and feed storage room.

Check the houses for red mites and the birds for lice.

Cull the laying flock closely to remove unprofitable layers and birds showing any symptoms of disease. Removing unprofitable birds helps relieve the meat shortage and saves feed.

Every poultry producer, large and small, can play an important part in helping save feed and poultry by increasing his efficiency in feeding and management practices. Efficiency on the farm is just as necessary as it is in war plants.

Advertisement for CARDUI Women's hair cream, featuring a circular logo and text: 'Women! Here is a name to remember. CARDUI. A 62 year record of 2-way hair help.'

In increasing plantings, he said, farmers should not overlook the importance of more food grain and hay crops which are essential if the full advantage is to be taken of the most favorable conditions.
