

## QUEWHIFFLE NEWS

by Mrs. Ralph Cothran

Dewey Strother and Paul Wilson left Friday for Miami, Florida, to spend several days.

Captain and Mrs. Walker of Texas are visiting Mrs. Walker's parents, Mr. and Mrs. Carl Riley.

Mr. and Mrs. B. F. Hardister spent Sunday in Angier visiting Mr. and Mrs. Dock Byrd and family.

N. F. Sinclair, Crowel Almond, B. F. Hardister and Rev. Henry Randall spent Friday and Saturday on the coast.

Miss Maggie McBryde spent the week end with relatives in

Durham.

Mr. and Mrs. F. L. Eubanks had as their guests for the week end Mr. and Mrs. Howell Gaskey of Concord, Mr. and Mrs. J. R. McLaughlin of Charlotte, and Guion Eubanks of Washington.

The McCain Garden club met Friday night with Mrs. J. L. Beal.

Will Calloway has been sick for the past week, but is reported to be improving.

Sugar production is highly important to the economic welfare of Cuba.

## Question And Answers About How To Get New Resistant Tobacco Seed

Which of the advanced lines are being considered for release.

Four lines which are under extensive test for the first time this year, are being considered.

1. A new line resistant to Granville Wilt. Many growers will recognize it by its experimental number—8238.

2. A new line with high resistance to both Black Shank and Granville wilt. The breeders' designation is 8259.

3. A new line with a pedigree similar to 8259 but only moderate resistance to Black Shank and

Granville Wilt. This line has been designated by breeders as 8213.

4. A new line resistant to Fusarium Wilt, designated by breeders as McCullers 27.

Who will decide whether or not these lines will be released?

The North Carolina Tobacco Seed Committee will decide. This committee is composed of agricultural specialists representing the State College Experiment Station and Extension Service, the S. Department of Agriculture, the North Carolina Department of Agriculture and the North Carolina Crop Improvement Association.

On what will the Committee base its decision?

The decision will be based on the performance record of the new lines in field trials. When the plant breeder develops a line which performs well, he appears before the Committee and presents his data. His records cover such things as yielding ability, resistance to disease, grade distribution and chemical composition of the cured leaf. He discusses the pedigree of the line and its characteristics, pointing out its good points and its weaknesses.

If committee members are convinced that the new line shows important improvements over existing varieties for use by North Carolina farmers, they approve it for release and give it a variety name.

When will the Committee act on the proposed release of these varieties?

At the next meeting of the Tobacco Seed Committee, December 12, 1949.

Why is it necessary to delay release until then?

Because it will take until that date to assemble data from the 1949 field and laboratory tests. This task is being done as rapidly as possible. At this moment, the 1949 crop is being graded and weighed, samples are being analyzed in the chemical laboratory and other samples are being run through rapid aging tests. If any

line shows serious faults, whether it be low yield, poor disease resistance or a tendency toward high nicotine content, that line will not be released.

What will be the name of the new varieties?

The Tobacco Seed Committee recently adopted a new system for naming new varieties. The essential feature of the system is that it employs a common variety name, followed by a serial number designating the principle distinguishing characteristics of the variety. "Dixie Bright" is the variety name chosen. New varieties resistant to Black Shank will be assigned numbers from 1 to 25.

Serial numbers assigned to others are: Granville Wilt resistance, 26 to 50; Fusarium Wilt resistance, 51 to 75; others with resistance to a single disease, 76 to 100; combination resistance to two diseases, 101 to 125; and agronomic varieties, 400 to 425. The numbers from 126 to 399 have not been assigned.

For example the new Granville Wilt resistant variety, if released, will be called Dixie Bright 27. The number system should help growers and others to correctly identify new varieties.

Where is the seed of these new varieties coming from?

The Experiment Station produced a small amount of seed of each variety this year. When a variety is released, the Station will furnish a small amount of foundation seed stock to the Foundation Seed Producers, Incorporated. This agency, in turn, makes these stocks available to Certified Seed Growers who produce a seed crop the first season and offer certified seed to farmers the second season.

Does that mean the average farmer won't be able to get any seed this year if a variety he wants is released?

No. The Station produced enough seed this year so that if the varieties proved satisfactory for release, each farmer who is in critical need of resistant varieties not now available could obtain a small amount a year earlier than would otherwise be possible. This also makes it possible for other farmers to try out the new varieties on a limited scale in 1950, a year before the seed would be available through usual seed channels. In most cases, the amount of seed available to an individual will be limited to 1/2 ounce.

No new variety will be accepted unless the farmers like it. Before a farmer can judge a new variety he must become familiar with its behavior, its adaptability to his soil, its growth habits and its curing characteristics. A new line may show high disease resistance and perform well in experimental plots, but this does not mean that it will perform well under on-the-farm conditions. Therefore, the grower will be wise to plant only a small acreage to a new variety until he is convinced that it is better than the variety he is accustomed to.

Are you sure there will be enough to go around, if the new varieties are released?

If every tobacco grower in North Carolina wanted seed, there would not be enough to go around. However, tobacco specialists have made a survey of the distribution of Granville Wilt, Black Shank and Fusarium Wilt. They have been able to make a fairly accurate estimate of the
