National Geographic News Service

WASHINGTON -- The infuriating thing about acid rain is this: Nobody is absolutely sure about its effects. There are lots of ideas,

but few are guaranteed to hold up.
Does acid rain affect lakes and
rivers? Certainly, the scientists

answer, some of them. But not all.

Does it threaten forests and cropland? Probably, the scientists say, but they aren't sure.

Fossil Fuel Product
How do the acidic substances get into the air? Most likely, from the burning of coal, oil, and natural gas, which releases sulfur dioxide and nitrogen oxides into the air. There they circulate with the great air masses from that form our weather systems

But scientists aren't sure what happens then to airborne acid, so it is impossible to "prove" that acid rain in New York was caused by smokestacks in Ohio.

Does it affect animals? Scientists are pretty sure it is harmful to fish and amphibians indigenous to acidified waters. But how about mammals? Maybe, some say; but don't know, and haven't been able to prove it.

And what about mankind? Are

we in any danger from acid deposition. Again, some scientists

THE ARTS JOURNAL

THE ARTS JOURNAL is a paradigm of what a good local arts review should be. Any North Carolina newspaper could be enhanced by including copies in their Sunday papers once a month. This is not to say its appeal is exclusively local, but that it provides valuable information and a calendar on local arts opportunities, divided by

THE ARTS JOURNAL shows a deep commitment to the arts of our time and our nation, with a particular focus on what is happening in the Southern Appala-chian Mountain region and in North Carolina. The framework of national and international art en-deavors is always kept in mind. It is even-handed in treating the different media.

There were not many sections exclusively concerned with painting and sculpture in this July 1980 issue. But there were three articles on dance, from the popular to the concert level.

'Maybe I am overly optimistic, but I also see in it (kicker dancing) a sign that some of the new generation are discovering that they can make their own fun." Harold

In this issue there is an interview with the outstanding photographer Harry Callahan and seven of his photographs printed between 1947 and 1968. There are news notes concerning crafts markets and an introduction to the work of Don Davis, fine potter. Among the theater news are reviews of newly written and newly performed plays and of drama festivals. There is a diary of a music critic.

In the literary field there are not only book reviews, but also a complete and moving short story, a gallery of five poets, a collection of poems by Marita Gavin, and a feature on the black woman poet, Jaki Shelton Green, who performed at Lake Julian, in Asheville, in July.

funeral glove/ that holds the and squeezes her pain." Jaki Shelton Green

"My grandmother was eighty-four when she died. I can not remember her face at all, though it has been a very short time ago. I remember only a photograph, of another wind, another time, of a beautiful young girl with a parasol and a smile." (from the short story by Lee Zacharias.)

The clear, refreshing visual illustrations throughout the articles and the calendar complement the literature and criticism.

Foster Robertson You may order THE ARTS JOURNAL (Editor, Patricia Arcuri) for \$1. single copy; \$10 for a year's subscription (12 issues) from 324 Charlotte Street, Asheville, NC 28801.

has proved anything conclusively. There are some things that scientists do know about acid rain, Anne LaBastille reports in the November National Geographic. and few of them are reassuring.

Among the certainties is the fact that 6 percent of all the ponds and lakes in the Adirondack Mountains of New York have no fish because of the high acidic content of their waters. The acidity has increased substantially in the past few de-cades, as burning of fossil fuels has

International Problem

The problem is not unique to the eastern United States. According to one chemist in Sweden, an esti-mated 20,000 of the country's 100,000 lakes are either fishless or about to become so.

The problem is thought to be the

discharge that drifts northward

from Europe's industrial belt.
Scientists have been working hard to find out more about acid rain, its causes and its effects. In the late 1970s, a nationwide network of 84 monitoring stations was set up to analyze samples of rain, snow, and dry fallout from 32 states. A similar group is monitor-ing samples from 55 sites in Canada.

Some areas of the eastern U.S. and southeastern Canada are re-ceiving rainfall as acidic as vinegar, the studies show.

But what this means, what its

consequences are, and what should be done about it -- these are

DOMESTIC VIOLENCE, Part II

North Carolina's Domestic Vio-

lence Act goes a long way in protecting the victim of violence in

the home. If a person seeking relief

files a petition alleging acts of

domestic violence, the court may

grant a protective order against the

lence. If the violence reoccurs, a

law enforcement officer, who has

been shown the protective order

and has reasonable cause to believe

that certain provisions of the order

have been violated, must arrest and

take into custody the offending

person and then bring him or her before an appropriate District Court Judge to show cause why he

or she should not be held in civil

alleged before the court will issue a protective order? Naturally, if one member of a household intentionally causes bodily harm to another, then that is the type of domestic violence which the statute

domestic violence which the statute

was designed to prevent, and a protective order should be issued.

Domestic violence, however, is not

always evident and easy to see. The

General Statutes, therefore, have expanded the definition of acts of

violence to include an attempt to cause bodily injury and the placing of another in fear of imminent

serious bodily injury by threat of

force. Domestic violence entitling

one to a protective order thus

includes not only past acts of violence but potential acts as well.

LAW

For Laypersons

efinitely answered.

While some scientists blame loose standards in some Midwestern states for permitting more than 10 times as much sulfur dioxide per ton of coal into the air as Eastern states allow, coal company scientists say there is no substantive proof that their smokestacks are responsible.

Standards Vary

The clean Air Act, which is up for reauthorization by Congress this year, requires that emissions from fossil fuel-burning facilities meet certain standards.

But each state is permitted to set its own standards, which leads some officials to blame the act for the increase in acid rain. Meanwhile, industry is reluctant to spend billions of dollars to modify existing plants unless it is proved they are responsible.

Such equipment, and others to control sulfur dioxide emissions, can make a difference, Miss La-Bistille writes. She cites the case of Japan.

Japanese officials issued stringent sulfur oxide controls in 1968 and encouraged the use of lowsulfur fuels and desulfurization. By 1975, emissions had dropped by 50 percent, even though energy consumption had doubled.

Even stricter limits have been set since then, and 1,200 scrubbers to reduce emissions from smokestacks have been installed, compared to about 200 in the United States so

the noun "violence" in the statute

implies that the violence must occur between spouses and not

between friends or strangers. The

General Statutes do, therefore, provide that the violent acts en-

titling one to petition for protective

order must occur between spouses.

The legislature, however, very care-

fully added that the violence could

because violence frequently occurs

between ex-husbands and wives as

a result of stormy divorces.

What about violence between aman and woman who live together

as husband and wife but who are

not married? Certainly domestic

violence can occur between those

two parties just as readily as

between spouses. North Carolina's

Domestic Violence Act includes violence occuring between persons

of the opposite sex "who are living together or have lived together as if married."

not be a tax-paying citizen of North Carolina. The Domestic Violence

Act provides that a party "re-siding" in the state may seek relief;

thus even a military family, which maintains its tax residence in

another state, can seek relief under

matter of general interest only. It is

not to be construed as legal advice, and you should not rely on the

statements made in the article to

'Mystery Bird' Discovered In New Guinea Mountains chainsaw to construct a landing

by Joy Aschenbach

WASHINGTON -- Scientists had never seen it before, but somewhere in the New Guinea region there was supposed to be an outlandish "yellow-fronted garde-ner bowerbird." ner bowerbird.

Its existence was known only from three skins sold to British zoologist Lord Rothschild by a plume merchant in 1895. Of the many spectacular species of birds of paradise and bowerbirds that also first turned up in the plume markets of London, Paris, Amsterdam, and Singapore, it was the only one that had never been traced to its home ground.

Rain Forest Hide-Out

At last, the mystery bird of New Guinea, Amblyornis flavifrons, has been found. Early this year, on his ninth research expedition to the region, California ornithologist Jared M. Diamond discovered the bird high up in the largest unexplored mountain range in New Guinea, the thickly rain - forested Gauttier (Foja) Mountains in the island's Indonesian half.

Dr. Diamond described this species as looking like "a fat, chunky robin with an incredibly glorious golden orange crest." It presumably had not been seen since unknown Malay or Papuan plume hunters snared the three male skins more than 85 years ago.

The lure for ornithologists was a strange bird whose bower-building relatives were known to construct the most elaborate structures in the avian world .-- to woo as many females as possible.

When these remarkable court-ship bowers were first discovered in the 19th century, they were thought to be the work of human artistry because of the complexity of their architecture and design. Built on the ground, some towering 7 feet high, they are the unique creation of small birds who work alone and are found only in Australia and New Guinea

The search for the elusive yellow fronted bowerbird had taken some of the world's leading naturalists and collectors - even a crown prince of Belgium - halfway around the world. But all of the more than a dozen expeditions. including one supported by Na tional Geographic in 1964, had ended in failure. And at times, the missing bowerbird was thought to

This year's attempt, partly funded by the National Geographic Society, succeeded because Diamond went to a mountain range never explored by scientists. "If we didn't have those skins, the tameness of the animals would make it seem that no human being has ever been up there before. It's like being in the world 30 million years ago," remarked Diamond, who had to be helicoptered in at 5,200 feet with a

Discovery a Bonus

Ironically he came across the lost bird when he wasn't really looking for it. "When I and anyone else who goes to New Guinea have dreams, we dream about finding the mystery bowerbird, but my goal on this trip was simply to do a general bird survey of this mountain range and help the Indonesian government plan a national park

there. The discovery was a totally unexpected bonus.

Far from being extinct, Diamond reports, the yellow - fronted bower-bird may number a thousand or more -- still a small number for a bird species. He actually saw about 30 and heard as many more. He found bowers spaced about a quarter - mile apart along the crests of ridges, within a narrow altitude band of 5,400 to 5,900 feet. The bird's range, he believes, is re-stricted to the Gauttier Mountains at altitudes above 4,000 feet.

Remarkably Diamond sighted both the bird and the bower on the first day (Jan. 31, 1981) of his two-week stay and within two minutes of his camp. With the help of an Indonesian forester and two New Guinea workers he was starting to clear a trail up to 6,500 feet and down to 3,200.

Initially, he almost ignored the bird, thinking its bower looked like that of another well-known species. "Only when I noticed that the crest was a golden orange and came down to the nostrils did I realize that I might be on top of the mystery bird of New Guinea," he

But he wasn't absolutely certain until he returned home and examined the Rothschild skins at the American Museum of Natural History in New York. The live birds and the skins were identical except for the color of the crest. On the live bird, it is a rich golden orange; on the skins, it has faded to a paler

Witness to Courtship

Diamond's most extraordinary curred when he stood within 10 feet of a male courting a female at his bower. It was the only time he saw two birds together.

"It happened one day when I was walking along a ridge and heard a

loud sound about 50 yards away. It sounded like gravel rolling down a mountain slope and I thought it must be a wild pig."

Instead Diamond discovered the male bowerbird "making these crazy wooing sounds while holding a blue fruit about a third the size of its head in its bill. The sounds ranged from clicks, croaks, whistles, and screeches to noises like crumpling paper or chopping

Huts and Lawns

Depending on the species, bowers may be walled avenues, thatched huts, Maypoles, or carefully laid out lawns. They are usually decorated with dozens or even hundreds of colorful flowers, berries, shells, or pebbles. Some birds bring fresh flowers to the bower daily and carry off withered blossoms.

Others paint the walls with crushed plant matter, using a stick or leaf for a brush. Near populated areas, the birds have incorporated bits of civilization into the design clothespins, bottle caps, marbles, shotgun shells, and car keys.

To enhance their own domain. some birds also steal from their rivals' bowers and sometimes even
