Ginners Schools

Began Monday

A series of four schools for cotton ginners got underway at 9:30 a.m. Monday in Dunn at the 19:30 a.m. and Johnston Counties are expected to attend. Other schools for ginners sceduled by the agricultural engineering department at N. C. State College this year

Red Springs, Friday, August 13, 9:30 a.m., at Liberty Manufacturing Company gin. Ginners from Robeson, Hoke and Scotland Nashville, Monday, August 16, 9:30 a.m. at the Nash Counties will attend.

Nashville, Monday, August 16, 9:30 a.m. at Long Brothing for the minimum prices previously announced for upland cotton was 31.25 cents per pound, basis middling 7|8 inch.

The average rate for middling 7|8 inch cotton, or 33.23 cents per pound, above the average rate for middling 7|8 inch cotton, or 33.23 cents per pound, above the average rate for middling 18 inch cotton, or 33.23 cents per pound, above the average rate for middling 18 inch cotton, or 33.23 cents per pound, above the average rate for middling 18 inch cotton, or 33.23 cents per pound, above the average rate for middling 18 inch cotton, or 33.23 cents per pound, above the average rate for middling 18 inch cotton, or 33.24 cents per pound in the chair make the price of their minimum prices previously announced for upland cotton was 31.25 cents per pound, above the average rate for middling 18 inch.

The chairman said that premiums and discounts for the various other grade and staple length combinations of upland cotton will also vary according to location. The rate for middling 18 inch cotton, or 32.23 cents per pound in the calculated in relation to the price will also vary according to location. The rate for middlin

crew and will deal primarily with the actual operation and technical aspects of the modern gin plant.

Upland Cotton To Be Supported At 31.58
Cents Per Pound

The average loan rarte for 1954 pland cotton, basis middling 7/8 inch, will be 31.58 cents per pound; gross weight, according to F. R. Keith, chairman of the state ASC committee.

Price support on 1954-crop up-

### GARDEN TIME

Amelia Giles-Cherryville, N. C.

1 Lot and House on Cherryville-Bessemer City Road

By Robert Schmidt

Now that the rains have come, many garden plants including dahlias and shrubs have broken out into rapid growth again.

This is especially important for dahlias because they have not had much opportunity to make good bush growth up to the present time. That means that there will not be so many blooms developed before frost. This is the time to give them the last application of fertilizer for the season. A large handful of a good garden fertilizer such as a 6-8-6 or 5-10-5 around each plant should be sufficient. It should be applied about 12 inches away from the plant and scratched into the surface soil.

From now until frost is the best part of the dahlia season. With plenty of moisture, fertility, and cool nights they will make rapid growth. This means that you will have to stake them and tie them the frequently so that storms will not break the plants down.

How can we keep dahlia blooms from wilting after they are cut? In the first place, some varieties keep better than others. If you are interested in cut flowers, you should grow varieties that are good for that purpose.

Many people advocate dipping the stem ends in hot water, or searing the stem ends with a match, but I have found that the best method is to cut the flowers early in the morning or late in the evening and immediately sink the stems in deep cold water. In whom on two they may be transformed to a vase for arrangement. Add some "Bloom-life" or "Floralife" to the water to prevent fouling. Add more water when needed but do not change the ife" to the water to prevent fouling. Add more water when needed but do not change the water daily as is the custom for some kinds of flowers.

Do not place dahlias in the breeze from open windows or electric fans. That will wilt them very quickly.

### STATE COLLEGE **ANSWERS**

Question: Is alfalfa really the "King of the Hay Crops?"

Answer: In one respect, yes. It will produce more feed per acre in good years and bad than any other legume forage crop, more even than permanent pasture or any other combination of plants. Alfalfa is however, still behind lespedeza in acreage. But alfalfa has a seven-month growing period, compared with two for lespedeza. Alfalfa averages three to 41-2 tons of hay per acre annually. A stand of alfalfa will lremain productive for several years if well managed.

Question: Is corn subject to greater insect infestation in the field than small grain?

Answer: Generally, yes. You can help prevent much insect damage to stored grain by harvesting your grain carefully. The longer grain stays in the field after maturity, the more it is subject to infestation. Becaues small grains are harvested quite soon after they mature, they usually are not seriously infested in the field. Corn is liable to greater field infestation than small grain because it is left in the field for a much longer time after maturity.

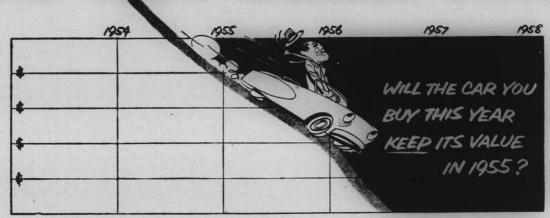

Question: What is the best way to apply lime?

Answer: Lime should be mixed thoroughly with the soil to be most effective. It should be applied at a time in the rotation of crops that will permit this thorough mixing. In order to neutralize soil acids, the lime particles must be in contact with the soil particles. For crops such as alfalfa or clover-grass pastures, sufficient lime should be applied at seeding to last several years since top-dressed lime is less effective.

# **PONT GET CAUGHT YOUR VALUES DOWN!**
