Farmers cooperating with North

Carolina's 43 soil conservation districts and others receiving assistance from U. S. Department of Agriculture's Soil Conservation Service have planted 192.284 acres, or about 192 million forest trees, SCS State Conservationist Richard M. Dailey announced to-

These trees, if properly spaced, would completely cover Durham County, or be enough to plant 10 rows encircling the Earth at the Equator.

proetection on 962,107 acres. Woodland improvement and site treatment practices include thinning, proper harvest cutting, natural reseeding, pruning and wood_ land weeding, or elimination of cull trees. Woodland protection includes fencing to exclude livestock, grazing control and firebreak construction.

Landowners are showing an increasing awareness of the economic benefits to be realized from woodland conservation. During 1960, alone, farm woodland owners receiving assistance from Soil Conservation Service through the soil conservation districts planted 24,670 . acres, or about 25 million trees; 17 miles of field windbreaks and 114,605 rods of hedgerows. They established 242,071 acres of woodland improvement practices, 2,969 acres preparation, and placed of site 27,789 acres of woodland under protection.

How efficient is your casting? Do you know that the right combination of rod, reel, line, and lure can help you cast better? Selecting the right combination of tackle based on your skill and fishing plans promises longer casts, greater ease, and more accuracy. When the tackle is right for the angler and the con-ditions, its called "balanced tackle".

Casting champions, such as International Champion Johnny Dieckman, who count on accuracy or distance and sometimes both together to win a tournament, use six to ten different rods in a tournament depending on the events. For their fly tackle they provide a different reel and line for each rod depending on the purpose of the event.

If you are planning to buy a rod for yourself, your wife, or one of the kiddies - keep these points in mind.

A stiff rod is more difficult for the beginner to work effi-ciently. It requires more coordination and know-how. But it offers the good caster greater distance with less effort. However, don't be sold on distance alone. While it is often the main reason for a choice of tackle -- catching fish is still the prime reason for buy-ing tackle.

The lake fisherman making long casts with light line may be willing to chance a broken line. If he isn't, he may compromise by giving up some distance and using a more limber 1-od to cushion the shock of light line and avoid unnecessary breakage.

If you fish swampy marsh land or tree-lined rapids where; anags are a constant threat, you may well prefer heavier line to avoid breakage. Of course, this will shorten your casts but long casts are less important than accurate casts and your tackle is by necessity "balanced" to your need.

The ideal outfit for the beginner and occassional angler is a spin-casting reel such as the Garcia Abu-matic 140, 160, or 170, a fast taper, hollow fiber glass rod designed for 1/4 to %-ounce hures, and the line which comes pre-wound on the spool. For those who plan to fish often and in a variety of conditions, an open faced spinning reel offers more versatility but requires more practice to operate efficiently.

You can properly balance your rod and reel by experimentation. Try different weight lines and varied lures until you strike the combination that's best for you, When you do - you'll find " " casts easier, more accurate, and - more productive.
