FREE - Your First Treatment with An-uric, my Kidney-Backache Tablet. Result of 50 years of Analyses in a Great Hospital.

years ago, my father, tre late Dr. Ray V. Pierce, established the famous Invalids' Hotel at Buffalo, N. Y., surrounding himself with a staff of skilful physicians, surgeons and chemists. To this great institution comes a steady tream of patients from far and

A great percentage of these patients are affected with kidney sease and many other thousands of kidney sufferers who do not come for treatment send samples for analysis.

So, here at the Invalids' Hotel, diagnosis and treatment of kidney trouble has been going on incessantly for fifty years.

Realizing the great need for an

effective home remedy to correct kidney troubles in their early stages, I put our staff to work on the problem. In time they worked out an ideal formula, which, it was found, could be put up in handy

I named this remedy "An-uric," because by strengthening the eliminative action of the kidneys, it works to free the sufferer from the evil effects of uric acid upon the nerves and joints.

I want all who suffer from weak kidneys, kidney backache and uric acid poisoning to have their first An-uric treatment at my expense. It isn't necessary to write-just pin this advertisement to a scrap of paper bearing your full name and address and mail it to me.

This offer is intended for those who have to get up in the night, who are tired and lame every morning, who suffer with aching back, dizzy spells, mysterious headaches, darting pains, sore, swollen joints and any noticeable irregularity of

the kidney action.

Will Prevent Much Loss When the owner's initials or number is painted on his cream cans, they have to be remarked frequently, as the marks become dim, due to washing and shipping. In order to avoid this I solder brass letters to the sloping part of the can, just below the neck, writes W. R. Taylor of Missourl in the Rural New Yorker. Copper or brass letters can usually be purchased at the variety stores, but if

not to be obtained they can be cut from a piece of sheet brass or copper with a pair of tinner's shears and a narrow chisel. Letters or figures made of aluminum will not do, as they are very difficult to solder. Cans so marked can always be easily identified and thus loss will be prevented. The lids should be stenciled or marked to correspond.

Dairy Cow Is Necessity,

Claims Florida Expert "As feed prices continue to soar, and the price of land increases, so will the dairy cow replace to a very large extent the beef steer, the sheep, and the pig as a producer of human food," says John M. Scott of the University of Florida experiment station. "And about the only rival the dairy cow has is the busy hen."

The dairy cow and the hen are the only two farm animals that produce good, nourishing food day after day, when properly cared for. They provide foods that are indispensable in

the home. "What is home without milk and eggs?" asks Mr. Scott. These items enter so largely into the preparation of food for the family, the cow meaning life itself to thousands of chil-

dren. "We owe the cow and the hen a debt that can be paid only by giving them the very best of care that they may produce the maximum amount of food," says Mr. Scott. And neither of them are now receiving the attention that will be theirs when their full value is realized.

Cow Is Highly Nervous and Is Easily Excited

The cow is a highly-strung nervous organism and easily excited, shocked or affected in one way or another to the resultant lessening of her milk flow. Turning her out on a cold. windy or wet day to drink ice-cold water causes a serious shrink in milk production. Weigh the milk night and morning, without fail, every day of the year and watch the record. That tells the story of such shrinks,

of Farm Implements

Best Plan Is Proper Housing of Machines in Winter.

There are two kinds of implement depreciation, namely, depreciation due to wear when in use and depreciation due to rot and rust when not in use.

Manufacturers of high-grade imple prove their products by putting better Sorry to learn our good friend Mr. material and better workmanship into E. L. Jenkins of R-1 is very ill with the machinery, which lessens wear, With these advantages supplemented Our good friend Mr. J. G. Walker with intelligent use and care of the opwho has been on the sick list for some erator, this form of depreciation can be kept to the minimum. The greatest depreciation, however, is the result of rot and rust, which takes place when implements are left standing in fence corners or in fields exposed to the elements, such as moisture, freezing, thawing and the hot sun. The wooden they were new.

The best method of preventing this sort of depreciation is by the proper shed should not be made expensive, but should be made with a tight roof, either inclosed on all sides or open on one side. As soon as the implements are ready to store for the season they should be gone over, bolts tightened and a memorandum made of the parts broken and any other necessary repairs. Shovels and shears should be removed and sharpened. This work can be done during the winter months when work on the farm is not pressing. The implements will then be ready for use when needed the following season, -J. W. Sjogren, Associate Agronomist, Colorado Agricultural College.

Canada's Road Building Is Progressing in West

Highways are being flung across Canada. Vast agricultural tracts that sprawl out from Winnipeg to the Rockies are becoming a network of roads that stretch like thin white ribbons to the horizon.

Canada believes that good roads are a first essential of rapid agricultural and industrial expansion, writes Edward Jerome Dies in the Illustrated The Canadian government, accordingly, has appropriated \$20,000,-000 to be used in construction of main highways and market roads. It is to cover operations for five years. Under the terms provinces initiate and carry out the road building, and the Dominion government, on approval of the plans, contributes 40 per cent of the cost. This guarantees standardization of roadways and places only 60 per cent of the expense on the provinces. Results are most gratifying.

The general campaign includes international automobile roads which will cement even more closely the trade relations between the United States and Canada. A highway from Ottawa to Sarnia, across the river to Port Huron, where the Victory highway cuts through Michigan, is being laid out by the Ontarlo Highway assocoln highway, which crosses the Jefferson highway near Ames, Ia. The Jefferson highway runs from New Orleans to Winnipeg, "the trail from the

From Winnipeg a boulevard highway is to stretch to points in North Dakota and Minnesota and across the Mississippi valley. Another international road will connect Alberta and

Frequent Cleaning and

Repairing Help Harness Frequent cleaning and oiling, and timely repairing, save time and labor and add many years to the life of a harness. Two or three rivets and a piece of wire, while all right in an emergency, need to be replaced promptly by more durable repairs.

During the winter, or on rainy days at other seasons, good opportunities are offered to go over the harness and replace stitches which have given away, or repair permanently these riveted splices or other parts which have been temporarily fixed.

Many farmers keep a supply of harness repair parts such as concord clips, conway loops, hame clips, trace splicers, repair buckles, buckle repair clips, lower hame clips, hame loops, repair cockeyes, and the like and find they can thus keep their harnesses in good condition at small cost.

Scours in Young Calves Caused by Indigestion

Ordinary scours in young calves are caused by indigestion. Either your calf has been getting too much milk or the milk is too rich in fat. The best treatment for seours in young calves is to reduce the feed. Do not let the calf have all the milk it will drink, and let it drink several times a day. Give the calf about two ounces of castor oil to clean the bowels.

Accumulation of Leaves

Shelters Many Insects

The accumulation of leaves and rubbish under hedges and in brush land offers ideal shelter for many injurious insects during the winter. Plans should be made to clean these areas up early this winter. Late winter and early spring burning of grass land is not as effective in chinch bug control as fall and early winter.

Clover Failures Serious Problem

Difficulty of Growing Crop Increased by Reduction of Plant Food.

(Prepared by the United States Department of Agriculture.) Clover failure is one of the most serious problems at present confronting the farmer in many of the clover sections. With continuous cropping and the consequent reduction of the mus and plant food in the soll the difficulty of growing red clover is greatly increased. This condition must clover or its equivalent from the rota- week. tion leads rapidly to a run-down farm

and unprofitable crop yields. Causes for Failure. may well look to the suitability of that Powell. particular field for the growing of lover before sowing the seed. There are many factors, say the clover men of the United States Department of Agriculture, which are responsible for the fallure of securing or maintaining stand of clover, but these factors may be placed in five groups: Soil exhaustion, improper seeding methods, nurse crops, etc.; unfit seed; diseases; and improper treatment the first au-

Clover falls more often, according to the opinion of these men, because soils Misses Lillian and and Evangeline have become poor in lime, phosphorus, McEntire. ootash, or organic matter than for all other reasons. If lime is badly needed, there is no use wasting clover seed. If phosphorus is the limiting factor, the addition of lime alone, even if the land is "sour." will have slight effect. Manure will do good more often than anything else, but when lime is needed the results from manure will be much greater after this need has been supplied than before. By making the soll conditions such as favor the growth of clover fallure can nearly always be turned to success. Crop for Improving Soil.

Where red clover cannot be grown be substituted for red clover, or it may News. be possible to grow mammoth clover for soll improvement after common red clover will no longer thrive, and by turning under the mammoth clover the soll may be restored to a condition in which it will produce a stand of red

Substitute for Milk Is

Favored for Young Calf While there is no substitute for milk in the feeding of young, growing animals, a mixture has been devised by the United States Department of Agriculture on which calves will thrive.

During the first and second weeks feed whole milk. The third and fourth weeks replace one-fourth of the whole milk with gruel made as follows: finely ground corn, 50 parts; oilmeal, 15 parts; finely ground rolled oats, 15 parts; dried blood flour, 10 parts; skimmilk powder, 10 parts and salt, at the rate of one pound of meal to nine pounds of water.

The fifth week use gruel and whole milk in equal parts. By the seventh week the gruel may be fed exclusively at which time one and one-half to two pounds of meal mixed with water will make a day's feed. Any signs of scours must be followed at once by a reduction in feed. The use of grain and hay is recommended with the gruel at the same rate as for calves

Pastures Benefit From

Application of Manure Five to eight loads of manure to the acre applied to the old pasture will he found a good practice on many farms. On most farms there come a period in the year when the manure cannot-be applied to cultivated land, with the result that too often it is allowed to pile up in the barnyard where it rots so rapidly that much of its value is lost before it is finally

spread. It is at this time that the application to the pasture is likely to prove profitable. In this way, the farmer gets immediate results from the application; he gets all the value there

Hours of Man and Horse

Labor to Produce Crops It requires ten hours of man labor and ten hours of horse labor on the average to produce an acre of hay. An acre of silage corn requires five times One Entire Month at our risk. Test it, as many hours of man labor and six and judge it by what you, yourself times as many hours of horse labor for its production as does an acre of hay. Potatoes and cabbage each require ten times as many hours of horse labor, while small grains such as oats, wheat, barley, rye and buckwheat require two times as many man hours treatment. and three times as many horse hours as an acre of hay.

Profitable Dairying Is

Based on Alfalfa Crop Profitable dairying is based upon alfalfa in many cases because considerable protein and lime are needed in milk production. For high producing cows grain is needed even when alfalfa is fed, but the feeding of alfalfa will reduce the grain re-
