

Will Double Murder Expose Crime-Politics Alliance?

Sensational Disclosures Looked for in Investigation Into the Murder of Crawford and Spencer, Anti-Vice Crusaders.

THE MAN WHO DEFIED THE UNDERWORLD
DAVID H. CLARK
ELECT HIM
Municipal Court Judge
Office No. 7
TUESDAY, MAY 5

Taking up the cudgels on behalf of the law-abiding element of Los Angeles and Hollywood, Charles Crawford, millionaire politician, and Herbert F. Spencer, veteran newspaperman, waged a ceaseless war upon the forces of vice and corruption until their tongues were stilled by assassin bullets. Many believe that their deaths will complete the work that they started in life, as the investigation into their murders promises to lift the lid off organized crime and its relation to politics in Los Angeles. Though their murders were not a great surprise, considering the enemies they had made in the underworld, the arrest of David H. Clark, which followed, was a distinct shock. Clark, a former deputy prosecutor in the District Attorney's Office, has won an enviable reputation as a brilliant and fearless lawyer, and was a candidate for Municipal Judge of Los Angeles. Police are also seeking June Taylor, alleged underworld hanger-on, and one-time confidant of Albert Marco, local vice chief, whom Clark sent to prison.

Disturbance Of Thyroid Gland

Dr. Copeland, Writing of "Graves' Disease," Describes the Symptoms.

By R. S. COPELAND, M. D., U. S. Senator from New York, Former Commissioner of Health, New York City.

ABOUT one hundred years ago an eminent physician named Graves was the first to describe a disturbance of the thyroid gland. In honor of this man and in appreciation of his classical work, the name "Graves' disease" still attaches to this ailment. It is similar to the condition referred to as "exophthalmic goiter."

Any enlargement of the thyroid gland is called goiter. This gland is located in the front of the neck, associated with "Adam's apple."

The victim of the so-called exophthalmic goiter usually presents marked exophthalmos. By this is meant large and protruding eyeballs. The presence of this sign alone does not necessarily imply that Graves' disease is the cause. Many individuals with large and protruding eyeballs inherit this deformity. It is often a family trait.

A rapid pulse, excessive perspiration, loss of weight, bulging eyeballs and enlarged thyroid gland are more positive findings of this condition. When all these symptoms appear, they prove pretty conclusively that this disease is present.

With the enlargement of the thyroid gland there is an increase in the normal secretion of the gland. It is a substance called "thyroxin." The excessive amount of thyroxin acts as a stimulating drug would, producing the rapid pulse and overactive body function.

The diagnosis of this condition is easily confirmed. The scientific tests distinguish Graves' disease from other similar diseases. Such methods of confirming or disproving the condition were not known in the days of Dr. Graves.
