THE PERCUIMANS WEEKLY. HERTFORD. N. C., FRIDAY, NOVEMBER 6, 1936

PAGE SEVEN

Good Farming Program	pour
Saves Soil and Moisture	be

Soil conservation and water conservation go hand in hand, says E. C. Jernigan, project manager of the Soil Conservation Service in Davidson County. Both depend upon a soil-building practices play the most important part.

Five simple and inexpensive farm practices are suggested by the Soil Conservation Service and State College Extension Service as contributory to soil and water conservation. They are as follows:

First-Subsoiling. Break the land 20 inches. This will increase the and also keep before the hogs at all water-holding capacity of the soil. Second-Terracing and strip cropsing. Break down the slop with a system of terracing and strip crop-ping that will slow down the water and reduce erosion. The strips of at State College close-growing crops will add enriching vegetable matter to the soil and make it capable of holding more water.

Third-Liming. To improve the physical condition by neutralizing the acids and increasing the legume crop yields.

Fourth-Rotations. Plan a rotation that will include as much closegrowing vegetation as possible.

Fifth-Retirement of lands. Take out of cultivation and put to pastures dr trees all lands that cannot produce crops at a profit.

Map Aids In Working Q Out Farming Program

The farmer who wishes to have a well balanced, profitable farming program next year will stand a better chance of succeeding if he works out beforehand a systematic, budgeted system of operation.

First he should consider the type of land he has, then determine what he can and desires to produce on it, said Dr. G. W. Forster, agricultural economist of the N. C. Agricultural Experiment Station.

He should estimate the number of acres he wishes to devote to various crops, the yield expected, the livestock and poultry he wishes to raise, and the commodities he expects to sell

After making preliminary esti-mates, he should study them to see whether they will make for a well balanced program. If not, he can then make the necessary adjustments.

It may be he will need to produce more feed for his stock, or he may see that it is necessary to cut down on cash crop acreage to produce crops for soil-building or for home consumption, Dr. Forster pointed out.

Be sure to estimate all expenses and compare them with the total expected income, the doctor continued. The program should yield as large a profit as is consistent with good farming practices. In working out next year's farm-

and the second of the second and the second second

Sows for spring farrowing should he bred by the early part of Nov-ember, at the latest. October 15 to November 1 is the best period. "If you do not have a portable

farrowing house, see your county agent or write the agricultural editor at State College for a copy of well-planned farm program in which blue print No. 160, which gives full instructions for building such a house for one sow and a litter of pigs.

> Taylor also suggested that in Nov ember some crop should be planted to furnish winter grazing for the swine herd. Castrate pigs when they are four to five weeks old.

Build a self-feeder: one will save well and subsoil to a depth of 18 to the labor of mixing and feeding slop times the feeds they should have. Feeders built by plan. No. 217, will accommodate one to seven hogs, and one by plan No. 61 will accommodate at State College.

Nance To Discuss **Pork** Preparation

With the arrival of cooler days and nights, farmers are again turning their attention to the annual task of "hog-killing".

In a radio talk on Monday, November 9, R. E. Nance, professor of animal husbandry at State College, will tell the Carolina Farm Features audiences of the most scientific methods of killing and curing their pork.

There are many old-fashioned notions about preparing pork which cause thousands of dollars to slip through North Carolina farmers' fingers every year because the growers didn't know how or failed to use more modern practices, Nance declares.

For example, says the swine expert, one of the most common beliefs is that hogs have to be killed on the coldest day of mid-winter. The job then is disagreeable, and too, there is a great danger of the meat freezing on the outside before tne animal heat escapes from around the bone.

The best time to kill, he points out, is a cool, dry afternoon. Allow the carcasses to hang in the smoke house or barn overnight and chill out slowly but thoroughly before cutting and curing the meat the following morn-

The proper time, proper tools, proper methods of handling, as well as other successful practices will be discussed in this talk.

COW MAKES CHEAPER MILK WHEN FED MUCH ROUGHAGE "Good pasture and other roughages." observes O. E. Reed, Chief of the Bureau of Dairy Inrustry, "are the basis for a low feed cost in producing milk and butterfat."

There are two reasons why pasture and other home-grown roughages help cut the cost of producing milk They are usually the cheapest crops in which the farmer can grow feed nutrients, and the cow can eat enough good roughage to obtain more
