GRAVEN TEST INDICATES NEW FERTILIZING METHOD

Two demonstrations conducted in Craven county indicate that fertilizer applied to the winter cover crop preceding corn will give better results than fertilizer applied directly to the corn.

In both demonstrations Austrian winter peas were sown last fall and turned under for corn in the spring, reported E. C. Blair, extension agronomist at State College.

On certain plats in each demonstration approximately 400 pounds of fertilizer containing 10 percent phosphoric acid, four percent potash, and no nitrogen were applied to the acre before the peas were sown.

No fertilizer whatever was applied to the corn which followed the cover crop of winter peas.

On five other plats, no fertilizer was applied to the peas, but 400 pounds of 0-10-4, 400 pounds of 1-8-5, 200 pounds of 2-10-4, 200 pounds of 16 percent superphosphate, and 200 pounds of colloidal phosphate respectively were applied to the corn acre.

Although definite results cannot be announced until the corn is harvested, Blair stated that already it is clearly evident that the best yields will come from the fields where all the fertilizer was applied to the winter cover crop.

He also pointed out that fertilizer applied to the cover crop does double duty, since it causes the cover crop to produce a better yield as well as the corn or cotton which follows.

He urged farmers to bear this in mind when sowing their winter cover crops during the fall.

FEED DAIRY COWS CULL SWEET POTATOES

Unmarketable sweet potatoes may be fed to dairy cattle with excellent results, says R. H. Ruffner, head of the animal husbandry department at State College.

Both the tubers and the vines make a good, palatable feed which will produce milk and butter of high quality.

But livestock men can afford to feed only cull potatoes or those which cannot be marketed for human consumption at a fairly good price, Ruffner pointed out.

Sweet potatoes contain about one-fourth the total feed value of an equal weight of corn. Consequently, dairymen cannot afford to allow more than one-fourth the price of corn for the sweet potatoes.

Sweet potatoes may be fed cows in place of corn silage. Since there are 25 pounds of digestible nutrients in 100 pounds of potatoes, while an equal weight of silage contains only 17 pounds, the cows will not need as much potato feed as silage.

When sweet potatoes are fed, the cows should also get eight to ten pounds of legume hay to balance the ration, as potatoes consist mostly of starch and sugar, Ruffner stated.

From 25 to 30 pounds of potatoes a day may be fed the average cow, but it is advisable to feed only five to ten pounds a day at the start. The quantity may be increased gradually as the cows learn to eat the roots.

The sweet potato vines may be grazed off by the cows, or they may be pulled and fed in the barn. Each cow can consume from 30 to 40 pounds of vines a day. Do not allow them to eat more than this amount, Ruffner added.

 A. G. Sargeant, Pastor
 Sunday School 9:45 A. M.
 Morning Worship 11 a. m. Sermon subject—The Stewardship of Life.
 Evening hour. Sermon subject — How Shall I Invest My Time.

BEEES NEED CAREFUL ATTENTION IN FALL

The value of next year's honey crop is largely dependent upon the care and management given the bee colonies this fall.

If the colonies are carried through the fall and winter in good shape, they will be ready for heavy production in the spring, said Frank B. Meacham, entomologist at State college.

Give all colonies a thorough examination in September, he urges beekeepers, and pay careful attention to the condition of the queen, amount of honey, number of bees, and space for brood rearing and nectar storage.

Young queens are best, since they produce a large amount of brood in August, September, and part of October. Bees produced at this time are the ones which survive the winter.

Three-banded or leather colored Italian queens, which can be purchased for 50 cents each from reliable breeders, are most desirable, Meacham stated. Replace all queens over a year old, or black and failing queens.

A colony which does not contain the equivalent of two or three Hoffman frames full of broods on Sep-

tember 1 is hardly worth wintering by itself. Often such colonies are not able to survive the winter.

Weak colonies can be united with strong ones by placing them together with a sheet of newspaper between. By the time the bees eat holes through

the paper, they will have become acquainted with one another and will not fight.

Over 400 Warren county tobacco growers have signed the new four-year adjustment contract so far.

IT PAYS TO ADVERTISE IN THE HERALD

There's lots of room in the FORD V-8

EVERY ONE who steps into the Ford V-8 for the first time is surprised at its roominess. There's exceptional seat room, leg room and head room in all body types — the whole car gives you a feeling of substantial size.

The Ford gives you extra body room because of the compact design of the V-8 engine — an exclusive Ford feature at a low price. This V-8 engine takes up less space in the hood and permits more of the car's length to be used for passenger comfort. Many a car selling at a higher price does not give you as much interior room as the Ford V-8.

Rear seats are wide and restful . . . three people can ride comfortably in the front seat of the Fordor Sedan, Fordor Touring Sedan, Convertible Sedan and Phaeton, and in the Coupes and Roadster. The seat of the Ford V-8 Roadster is 52 inches wide. A ride in the Ford V-8 will show that it combines unusual body room with fine-car performance, safety and comfort.
