

FACTS ABOUT *Marijuana*

Contrary to many young people's beliefs, marijuana is a harmful drug, especially since the potency of the marijuana now available has increased more than 275 percent over the last decade. For those who smoke marijuana now, the dangers are much more serious than they were in the 1960s.

Preliminary studies have shown chronic lung disease in some marijuana users. There are more known cancer-causing agents in marijuana smoke than in cigarette smoke. In fact, because marijuana smokers try to hold the smoke in their lungs as long as possible, one marijuana cigarette can be as damaging to the lungs as four tobacco cigarettes.

New studies using animals also show that marijuana interferes with the body's immune response to various implications for those infected with the Acquired Immune Deficiency Syndrome (AIDS) virus, Human Immunodeficiency Virus (HIV). Although not everyone infected with the virus gets the disease, those who use immune-weakening drugs such as marijuana may increase their risk for developing full-blown AIDS.

Even small doses of marijuana can impair memory function, distort perception, hamper judgment, and diminish motor skills. Chronic marijuana use can cause brain damage and changes in the brain similar to those that occur during aging. Health effects also include

accelerated heartbeat and, in some persons, increased blood pressure. These changes pose particular health risks for anyone, but particularly for people with abnormal heart and circulatory conditions, such as high blood pressure and hardening of the arteries.

Marijuana can also have a serious effect on reproduction. Some studies have shown that women who smoke marijuana during pregnancy may give birth to babies with defects similar to those seen in infants born with Fetal Alcohol Syndrome - for example, low body weight and small heads.

More importantly, there is increasing concern about how marijuana use by children and adolescents affects both their short- and long-term development. Mood changes occur with the first use. Observers in clinical settings have noted increased apathy, loss of ambition, loss of effectiveness, diminished ability to carry out long-term plans, difficulty in concentrating, and a decline in school or work performance. Many teenagers who end up in drug treatment programs started using marijuana at an early age.

Driving under the influence of marijuana is especially dangerous. Marijuana impairs driving skills for at least 4 to 6 hours after smoking a single cigarette. When marijuana is used in combination with alcohol, driving skills become even more impaired.
